I gave up on Popular Communications a year ago, but still find enough
in Monitoring Times to justify the subscription price. I agree that its
content is rather superficial though.

Let me turn the question around and ask what publications an experienced
listener (or even a newcomer with aspirations of graduating past the first
grade) should subscribe to. Are there communications periodicals which
are geared toward the serious listener, with a focus on information
rather than on being entertaining? I presume that any such publications
will be more specialized than Monitoring Times, and that choosing one will
depend upon which specific aspect of monitoring one wishes to pursue (i.e.
shortwave broadcasting, HF military monitoring, maritime, VHF/UHF scanning,
AM/FM DXing, etc.).

I guess a long way about it would be to make it a limit search with the
frequency as both the high and the low limit. Then you could save it as
a monitor channel. Then maybe transfer it to a bank channel.

Not a real timesaver :)

nobody <nobody@vox.xs4all.nl> wrote:
>What is a good directional antenna for 40-50 MHz? What is the practical
>range at which one can receive pick up cordless using a Yagi?
>
Well, the distance from which you can pick up cordless phones using a Yagi
is limited by the transmitted power (not terribly high), and especially
two other factors: The gain of the transmit antenna, and the gain of the
receive antenna. (I'm skipping all the math junk I learned last year in
my antennas class :-)

Since most cordless antennas are not the best things in the world, and
since they transmit at relatively low powers, that means that to hear them
from large distances, you would have to have a pretty good receive
antenna. That, in concept, at least, if feasible.

There's only one thing: a Yagi meant for 49MHz is not going to be your
typical light, hand-held, easily mobile antenna. The wavelength at that
frequency is ~300/49, or 6.12meters=~20ft. So a 1/4 wavelength above the
mast of the antenna, and another 1/4 wavelength below, means a Yagi with
element lenths of approximately 10 feet.

Then the whole idea of the element spacing comes into play (I won't get
into the numbers on this part), and what you end up with is an
unmanageablely large antenna useful only for mounting on a tower or some
other similar structure.

So, yes, you can build a good Yagi antenna at any frequency you want, but
the issue of its size is often prohibitive at lower VHF frequencies.

Sherrod

The annual Dickens on the Strand Christmas celebration is this weekend (12/03) in Galveston. The Galveston PD are using 460.225 mhz for comms along the strand. Another freq is in use by the folks working events (gates, booths, clean-up, food, etc) but I could not find it. I searched all the UHF splinter freqs but it was not there. It may be a VHF freq (the antennas on the handhelds were UHF or VHF, not 800 mhz).

FYI... First I hook the clip onto the legs of the IC about 30 degrees
from the circuit board. Second make sure the clip doesn't short out other
pins of the IC. Last, I hot glued the clip right to the RF tight metal
case, right next to the IC. That will not come off even when you shake
the 2006.

6336. OKI 900 + PC can target MINs

Newsgroup: rec.radio.scanner
Date: 1994-12-04 18:52:09 UTC
From: nobody@vox.xs4all.nl
Message-ID: <199412042131.AA01979@xs1.xs4all.nl>
Source record: 264699

In the premiere issue of WIRED, John Markoff of The New York Times wrote about V.T. and N.M., two Silicon Valley "telecommunications hobbyists" who were among the first to discover that cellular telephones could be reprogrammed to do new, wonderful things. One especially intriguing idea they had was the following:

"V.T. and N.M. have considered writing software to particular phone numbers. They could easily design a program that turns the OKI 900 on when calls are originated from a specific number, or when specific numbers are called."

Several companies manufacture hardware units that will scan cellular freqs for specific MINs, ignoring all non-targeted cellular trans-missions. Tech Support Systems of Menlo Park, Calif., makes the Cellmate, which fits into a briefcase and can scan for up to 10 MINs (area code + seven-digit number of the targeted telephone) at a time. Another company whose name escapes me makes Mac-based unit called the Triggerfish which does the same thing. These systems cost 10s of thousands of dollars, and the manufacturers will sell only to cops and spooks.

I'm not a programmer, but it would seem to me that V.T. and N.M. have a practical idea. With just a little work writing code, one should be able to make a software program that would enable an OKI 900 or any other cellular telephone with a PC interface to target cellular telephones by their MINs. Just as Phil Zimmermann's freeware PGP program put strong, practical crypto in the hands of ordinary people without badges and big budgets, the writer of a MIN scanning program could enable ... Well, you get the idea.

Below is one the things that intrigues me about the AR8000.
It shou be able to do the same thing under software control.
You can target certain phone numbers if you are in law enforcemnt
and track considerable data about them by using I believe the top of
the line icom vhy uhf radio. I forget the model number but it is
a desk unit. I saw in Nuts and Volts about a year ago there was software
and a commercial interface for cellular technicians to track calls
in their cell systems.

If any one knows were those articles are in electronic format
I would like to have a copy of them. I gave my issue away to a buff.

IF IT IS POSSIBLE to control the ar8000 while the radio is on from
a software program one could route the data from the audio
to a decoder and serial port for input and use that data
to switch the other vfo to the proper signal with your targets speech.

The switching signal is heard on the target channel and yoiu merely would have to follow
its instructions
to go elsewhere or go back to scanning the data channel for fruther instructions.

Am I correct in this? I am trying to remember what I learned about how the
cellular ssytem worked.

Next would be how to follow a TSR used by public saftey. Another
rainny weekend project.

Any comments

mailto:vic@PING.COM

PS I learned a few minutes ago the unix os requires some urls
like the one above to have mixed case before they will work.
You can always mix the case of machine domain since it dosn't matter
to the server.

I have to say it seems that dealing with Jonathan is as they say,
though I haven't received my radio yet. I ordered it via a
phone call to Bradford UK. Several hours later was email with a tracking number
and a check sat showed it was in US customs. You can
check only after 8PM on Sunday and they told me that it had cleared customs and was
enroute for am delivery Mon.

Now that is fast I think considering how another told me he ordered one last tuesday
from US source and expects it sometime mid week next.

The cost came to 450LB with the extra stuff I ordered.
Looking in Sat's business news it said the exchange was 1LB = 1.56 US.
That comes to $744.12 delievered after you add the 6% US import tarrif.
When Gatt goes into effect it may be even cheaper. :>)

> 208.200 WFM Wireless Mics
> 209.000 WFM Wireless Mics

I think you'll find more baby monitors in 49-50 than wireless mics.
I spent one summer working for Cetec-Vega in El Monte, CA. They make
(made? I haven't talked to anybody there in years) top-quality wireless
mics that were frequently ordered on VHF TV frequencies. When I asked
about that, the answer was that they were ordered by local companies that
rented them out, and they were on _unused_ TV channels in that area.

So look at the TV channel allocation chart in a reference book and try
searching the unused TV channels in your area. I'd try the wide FM
mode. You'll probably find multiple signals - one of Vega's products
that was sold on TV frequencies was the "six pack" - a single box with 6
receivers, diversity antennas, and a audio mixer, and six wireless mics
on different frequencies. They also made 9-packs and 12-packs.
This system allows on-the-fly audio management, allowing any mic or

combination of mics to be killed by itself (Watch a Garth Brooks concert sometime - he has a hand signal he uses when he has to cough. This alerts the sound man to kill his mic for a second).

I tried to borrow a 6-pack for my wedding, but the sales manager was overseas for 3 weeks. My idea was to have a 6-pack feeding a multi-track tape deck - one track per mic - resulting in nice clear audio from each person (the preacher, the lector, my wife's father, my wife, my self, etc) on the final edit of the video tape... Oh well.

Have fun scanning....

> Neer Danielli
> nldaniel@mailbox.syr.edu

I've tried several, and I end up coming back to Microsoft Access.
I've set up a small database which includes freq, service, channel name
(their name - like "Freq 1"), callsign, use (like "prime dispatch"),
site (like "Mt. Wilson"), building (like "MRA"), and a Notes field.

Many local sites have multiple buildings. One of my hobbies is ham
radio, and I do some part time work for a two-way house. One ofthe
things I help do is interference tracking and analasis, and many times
it helps to know what site a given signal is coming from, and once in a
while what building. So when I find out, I add it. Then down the road
when we have a problem on Mount Lukens, we can seperate all the sources
on thet site out and check each frequency for problems...
PS: "MRA" is Mobile Radio Associates - they have buildings on a dozen or
so sites here in LA. Used as an example only.

I'm about to return the Bearcat 8500 that I received the other day, and I was wondering if anyone had any information about the 9000 XLT that's supposed to come out next month. Specifically, I'm wondering if it's going to have the features of the 8500 (500 channels, alphanumeric, CTCSS) without the pitfalls (you can only program CTCSS and alphanumeric on the first 250 channels. If anyone has any information, even unsustantiated rumor, I'd be interested in hearing it.

Thank you for your help.

6358. Looking for a way to get signal from scanner to modem?

Newsgroup: rec.radio.scanner
Date: 1994-12-05 05:29:32 UTC
From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <JW3U+2c.gregmason@delphi.com>
Source record: 264715

I was answering a post from someon asking for a way to play scanner audio to a friend on the phone. It occured to me that the scanner-modem question is the very same one.

I told the person that they should get a radio shack telephone recorder. You know the type that has the female modular plug in it? Just plug the audio in/out jack into the scanner earphone plug. I tried this after posting, and and of course, it works.

It occured to me that people asking for an easy way to connect their scanners to their modems would benefit from this trick.

Let me know if it helps.

I consider 800 MHz trunked communications annoying in general.

Especially when more than one department trunks through the SAME group
of frequencies. That way, you can't set your scanner to scan through
the group of frequencies and expect to hear your ONE favorite department.

I guess that won't be a big deal when communications go digital. Then
we won't be able to scan them at all (in the normal fashion at least).

Source record: 264579

Reading thru todays Washington Post Business Section and found an interesting article.
The National Weather Service has developed the Wireless Weather Information Network (WWIN). They transmit from Silver Spring, Md.. Signals "carry text, graphics and satellite photos to anyone who has a personal computer, a $60 police scanner and a special $150 hardware and software kit."

Sounds interesting, perhaps take the audio from the scanner and try to decode the data sent. Now to find the frequency.

Any ideas?

Scott

I do not know of any link between FTP and Usenet (r.r.s). It is possible that some FTP site has Usenet messaged archived, but I am not aware of any such sites. I do know that there are some places you can send e-mail to and if you format it properly, it will get posted to whichever newsgroup you want, but that won't let you read the messages. Probably the best way to get access to r.r.s is to find a local BBS that carries the traffic (and supports off-line message reading).

THe 8000 is a hand held, not a desktop. If you can get a Pro-2006, that would be the best desktop currently available. I would put the AR3000A second, but it is over your price range.

Like Jeff said, you may want to wait until Uniden releases the 9000xlt base unit. Who knows, maybe Uniden will get it right this time.

I have tried several but IMHO Microsoft Excel is the absolute best way
to mangage frequency lists for scanners.You can paste a copy of plain text
into it with frequencies and then convert it on the fly into data format
that you really can manipulate! The output can be easily moved to other forms
for compute control of the scanner.

The little applet that comes with os/2 warp is pretty but not anywhere
near as powerful or as easy to use. It may be a start though for someone just
playing around who dosn't really care that they may reach a dead end in choices.

I have seen lots of ideas on this. The most simple method seems to be to get some condutive tape - You can get the stuff from hardware stores. I was also told pilot shops carry "propeller" tape that is conductive. Cover the top and bottom case with the tape and make some connection from case to ground.

It is a combination of two tones mixed together that you hear
and that can be decoded by circuit to unlatch the receiver's
audio and set off a local alarm. In the Atlanta metro area the NOAH
Weather System is tested every Wed morning. Before I bought one
of those $19 alerting receivers from RatShack while working I
would tune a vhf radio to local continous broadcast during severe weather.
Then if I heard a tone instead of the continous chat you know I paid close
attention to the urgent broadcast.I usually give gifts of wx receivers
each spring when the go on sale and the weather gets 'hot'.

There are new developments that others may fill you in on as to details.
The government can take over local broadcast and cable tv systems
with the flip of a switch for things like a tornado warning.
This was use locally for the first time last year by our
local Cobb County government and some others.

You can't easily modify a wx receiver to work as an alerting
unit on the ham bands. I would modify a pager first as it would
be esier and cost the same. MHO only.

6371. Finally got one...

Newsgroup: rec.radio.scanner
Date: 1994-12-05 13:31:49 UTC
From: R3PMP@VM1.CC.UAKRON.EDU
Message-ID: <1708377F5S86.R3PMP@VM1.CC.UAKRON.EDU>
Source record: 264724

I finally did it, I bought a PRO-39. I am having a good time with it, and was wondering if there are other sources for frequencies besides searching. I do a lot of traveling and it would be inefficient for me to search every time I pass through a new part of the country. Is there a book that lists basic frequencies by geographical location?
I was impressed with the Radio Shack salesman. He handed me a page full of local frequencies when I bought the scanner. That was very helpful.

Also... I'm using (for lack of the correct term) one of those things that connects the coax in computer networks to the network card. I use it as an elbow for my antenna so I can lay the scanner flat and keep the antenna vertical. Does anyone know if this will affect my reception?

Thanx.
Pat Prather

6372. SW Radio Reviews (VERY LONG - 65K)

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home (no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year now and am really pretty happy with it.

Advantages: Size - Measuring approximately 4 3/4 x 2 5/8 x 1, you can take this little mini anywhere! Even slip it into your shirt pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m, 25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals, no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The SW sensitivity is quite good for my area of the country, Cleveland, Ohio. The speaker has a nice sound and improves thru the earphones. FM stereo thru headphones is great! MW DXing is surprisingly good! I can grab signals from Boston, Chicago, New York and Cincinnati much better than on my Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun to fiddle with or take for travel when you're in a pinch. Radio Shack has discontinued this model so you might be able to find it on sale for around $50.00. I love the size! Ideal for travel! I'm

beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening
because it was the cheapest thing at Radio Shack. I think I paid $60
for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the
price, but not too great. When I'm at home (western US) I can pick up
the major international broadcasters, but no too much else. On my trips
back East, I've found sensitivity picks up some, but it's still only
fair.

Performance on the AM and FM bands is average, but longwave seems to be
nearly useless. I've never heard any nav beacons on this one, even
though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these
up when I bought my radio. It helps reception a little, but not very
much. A much better solution is to wrap a stripped end of a wire around
the the whip antenna, and attach the other end to a metal windowframe.
I've tried connecting my longwire to it, but that just overloads the
receiver (not surprising).

One major problem that I've noted is that the dial markings on some
shortwave bands seem to be off by up to 10 kHz. If you know about it,
it's not much of a problem to work around, but initially it could be
quite confusing.

Overall, this receiver is average for its price. There's no real
surprises, either good or bad. If you really want an inexpensive radio,
go for this one. Otherwise, I would advise saving your money and going
for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a
rebate. For the price I think I got a good deal. It has digital tuning
and direct input of frequencies which allows tuning to be a pretty
simple job and not a time consuming act of patience. It uses two C type
batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it' soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify this. I bought it on sale from Radio Shack for the bargain price of $129.95! It regularly retails for $179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380 is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost!

(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the 390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each

memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells)

They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz

increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right.
Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65 17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick)

analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer

memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still

don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB
or CW, poor FM reception. All in all, not a bad radio of $69.90,
however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers.
I have recently bought a DAK Model DMR-3000, for just
$69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired
frequency, and a manual / automatic scanning system. It also has
a dual time clock with alarm and 'sleep' timer. Unfortunately you
can tune only to the commercial frequencies on SW, AM and FM
bands. I have to say though that cheapness comes at a price. The
first receiver I got was defective so I had to ship it back and
ask for a replacement. Now, I received a new one which works very
well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive
brick. The fancy clock and timer features aren't really worth it.
About the only thing nice is the FM Stereo support if you plug in
headphones but the FM sensitivity leaves much to be desired as
well.
Something else to watch for.... That pretty lettering on the
buttons will wear off REAL fast. If you haven't used it much yet
you won't see a wear off REAL fast. If you haven't used it much
yet you won't see a problem. After you've done some tuning you'll
see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most
people agree is the best all-around radio for this price. Good
points: excellent frequency band coverage (150kHz to 30mHz), fine
tuning, good selectivity, BFO for SSB and CW, many scanning
options, lots of accessories included, good AM and FM reception.
Bad points: way too big to travel with, high battery consumption,
synthesizer noise in background all the time, scanning frequently

skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour

clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is
covered from 7100 to 7300. So if you want to listen to the BBC
on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European
signals during the day that I cangrab when I attach a long wire.
The 3625 can't tune these freqs. but it can grab 15400 (from
africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a
Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average
selectivity. Covers MW (in 10 kHz steps only), FM (no stereo),
and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-
in timer/clock (12 hour format only), 5 programmable memory
locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers
MW, FM (stereo through headphones), and SW in 8 bands (roughly
split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and
60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth
listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic
window for the digital display, which the factory replaced. It is
an extremely sensitive receiver. I installed the FM detector board
option, which is highly useful for Sub-Carrier detection from FM
broadcast receivers in conjuction with the R70's ability to tune
below 100khz without a frequency convertor. The so-called PassBand
Tuning (PBT), in actuality an asymmetrical bandwidth narrowing
control, is very mediocre with the factory 455khz filters. Replacing
the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole
crystal filter (equivolent to the ICOM FL-44) makes the passband
filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than

the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's low-pass audio filter, giving better bass response than normal SSB mode on the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option board; both can coexist. Installation is somewhat difficult, as it involves connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This installs fairly easily in place of the narrow CW filter. It is very much better than the stock ICOM 6 kHz bandwidth, which is wide-open until it hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter. They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard synchronous detector for the R71 as well as other receivers. The Kiwa MAP unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual, which details mods like enabling the preamp on MW, true pass-band tuning, sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to put it in here.The TS-450S is an amateur transciever that costs little more than a R-5000,and if you have your ham ticket or are thinking about getting it,may be worth checking out if you are in the market for a new toy.I'd be willing to bet the replacement for the 5000 will look just like the 450,just like the 5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that is unlike any other I've ever seen.It is almost too bright!The brightness cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes except for fax.It has a"normal"keypad unlike the 5000 and the aggravating CW that is produce when a major button is pressed can be silenced by y -a simple menuss,you dont have to cut a wire like the 5000he S-Meter is a bar-graph type that I like but some people dont.It also has an Audio meter function that kin baffles me.I still dont know what use it is,but it looks nice!Probably the most notable thing you will observe when using the 450 is the QUIET!It is so quiet,it seems strange the first couple of times you use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest

and slowest AGC I've ever seen,on slow the S-Meter just sits there and then SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is really odd.The stock filter for AM is a mile wide but you can add the YK88 AM filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one of the better Murata ceramic filters and is ok but the optional SSB filters are highly recommended.The audio is FANTASTIC on all modes and if you put one of the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother with the Kenwood speakers,the one that goes with the 450 is not too good and is expensive too!The ergonomics are pretty good,except for the tuning knob,yes like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why does Kenwood insist on putting these awful knobs on all the rigs they have made lately!All in all,it is a very good riever in almost all respects,and since t it only costs about $100 more than a 5000,it is worth a lookND as a bonus, the recieve coverage goes up to 40 mhz!If you are into low band scanning,you will hear things on the 450 you never knew existed on your scanner.If you can swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive
you bonkers if you have good hearing and a speaker that can put out the highs.
I have had two of these,the first I traded for a sateite setup,and the one I
have now.The newer reciever has mucbetter audio then the first one and lesess
hiss too.Ergonomics are very good MUCH,MUCH better than the Drake
R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the
U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh
well,back to the 525,if you are into AM,it's probably not the reciever for you,
but in allthe other modes,it is one of the best consumer grade recievers ever
made.Performance in all modes is basically excellent except fothe audio pr
problem,and stability is rock solid.JRC has only cut a few corners compared
to the 515,probably the ultimate in construction for consumer recievers.
The case is made of very thin sheet metal and the front panel is plastic.The
keys fit loose in the keypad but work ok.The display has four brightness
levels and is very easily read from across the room.The S-Meter is "digital"
and is a floating vertical bar segment that seems to be yellow on some samples,
and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the

received signal is strong to begin with. Don't waste your money on the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the serious DXer but it has some shortcomings. The 535 is much better than the Icom R-70 that i had before, and i would recommend it to anyone that asked me. What you might want to do is change the filters to somewhat sharper filters. That goes for both the 9 MHz and the 455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the Sony ICF-SW33 and the Sony 7601). This rig is an extremely sophisticated piece of equipment. I especially like the fact that you can store up to 125 frequencies on 25 electronic pages that can be named as you wish (by country). Once programed this is very convenient. The two filter selections are well chosen (much better than the stock Sony 2010 filters). My use the radio to copy WEFAX with excellent results attests to its stability (and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow automatic recording with certain tape recorders (Sony and others) of up to five times and frequencies in a 24 hour period. I use this feature all of the time. Audio (stereo on FM) qualitity for a portable is very good; better I believe than the stock 2010 although as with the 2010, it is improved with a set of external speakers.

Unlike the 2010, the SW55 does not have synchronous detection. That's too bad because I believe that if it had this feature it would blow away
tition. As it stands it is an excellent radio. Most interference can be eliminated with the narrow filter or moving away from the interference a bit (the radio is tunable in steps of 0.1 kHz) so the lack of sd is not critical. I really believe that Sony did not include it because it would have then had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE

keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now that I've said that, you should know that I am new to all of this "DX-ing" (is that how you say it?). However, I can tell you that it's reception with the built-in antenna and with the included auxiliary antenna is very good. I found that the radio comes pre-programmed with a number of stations (BBC, Radio Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high quality, delivering plenty of volume and good sound. There are several "tone" switches (news vs. music setting, etc.) that enhance the reception and its sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to other radios since I didn't comparison shop). There are several output jacks that make it easy to connect to external speakers, tape recorders, headphones, etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do.

The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position
Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient

frequencies, like the propagation beacons on 14100 KHz. There are
a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous
detection (this is supposed to be sent out as an upgrade chip later), and
IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think
it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM
(SAM) detection in my HF-1000 receiver. I was able to install it in
about 1/2 hour and it worked great. In testing it I compared it to the
ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter	ESKA+NRD	HF-1000+SAM
Weak signal lock range	+- 20 Hz	+-250 Hz
Strong sig lock range	+- 40 Hz	+-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1 (More Info is Available by e-mail from (jlloyd@cs.clemson.edu)

My general impression, is that this is anyhow a very good apparate. It offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing, quite good operating commands, triple conversion, 400 memories; it is very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected front-end band filters reduce to some extent unavoidable intermodulation. In general, this set offers a self contained and very well balanced compromise of a lot of different demanding features, but will show its best when fully interfaced.

Its price, here in Italy, has been varying greatly during the years. Therefore I cannot say how it really competes with the choice of HF receiver + scanner setup. It is still unclear to me how far is the AR3000 from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going to list (I would like to hear comments about), but perhaps I'm just pretending too much from a receiver in which something had to be traded off between versatility and performance. Please note that I have a 4 years old AR3000; some defects could have been amelio-rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack of a variable Am bandwidth. SWL in crowded bands is too often spoiled by the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent signal lying some -+30 khz apart. I suspect this may be rather a problem of AGC voltage (see below on squelch), because the feedback signal is obtained from the previous to the last i.f. stage, which may have a larger than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional. On my set almost everything passes for knob positions below .3 and only >S6 passes when I increase to .5. It may be a problem of adjustment, but also reflect the inaccurate behaviour of the S-meter, which (I have no measurements to support) seems not properly logarithmic. I have the impression that weak signals give a high S readout when close to stronger ones, because the S-meter averages on a larger bandwidth than the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity improves a lot when connected to an external speaker or lineout. No noise reduction circuitry is present. External audio equalization does a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different demodulator (say wide band AM for satellite or TV, stereo FM decoder, sinchro SB AM decoder). A modify could be to buffer it to a backpanel jack.

-Intermodulation IS present. I live very close to power MW transmitter, and in the times they're on the whole band .5 : 2.5 Mhz is unusable, with crosstalk on every possible combination of transmitter frequencies. At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even with a short random wire antenna. However, I don't hear crosstalk due to FM transmitters, which are also close to my place. The 13 front end filters seem to do their job, since strong signals don't cause crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In the AR3000a it has been replaced with a (I guess optically encoded) smooth one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod itself seems quite easy too.
The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is

very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories .
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

Attention: J&R Music World Customer Service 1-800-221-8180
59-50 Queens-Midtown Expressway
Maspeth, New York 11378-9896

Dear J&R Music World,

In 1993, I wrote to J&R Music World when I was dissatisfied because I could not return a shaver (I ended up with a full refund from the manufacturer). I was very upset at J&R Music World's "non" return policy on some items, and opted to take all my future business elsewhere. Additionally, I felt compelled to post my bad experience on the world-wide Internet bulletin board, and did so. In my public letter, I was careful to point out that the reason I felt so compelled to waste so much of my time on this matter is that J&R Music World does offer a very good product line at very competitive prices, and that I regretted that I would be paying more just to avoid such negative experiences in the future.

I must confess that I have ordered several items from J&R Music World recently and I have been very pleased every time. While I no longer buy personal items (which cannot be returned once they are used), I do not hesitate to buy other items from them. Their phone operators are always knowledgeable and I have always received exactly what I ordered and have not had any negative experiences since the incident of the non-returnable shaver.

Most sincerely,

John P. "Quill" Taylor

I've put together the following list from several different sources.
Have fun!

US Secret Service frequencies

(weasel@acca.nmsu.edu http://rever.nmsu.edu/~weasel)

Routine transmissions will probably be in the clear. If the President
is in town, expect transmissions to be DES encrypted (try the local
police departments and media in this event).

Chuck Gysi (scan911@aol.com) has suggested the following for CTCSS-
capable scanners, in order to eliminate receiving DES transmissions:
set the CTCSS tone to 103.5 Hz. This only opens the receiver for
'in-the-clear' transmissions.

32.230 Able WHCA Transportation
166.5125 Alpha Escort and security

/Reading thru todays Washington Post Business Section and found an interesting
/article.
/The National Weather Service has developed the Wireless Weather Information
/Network (WWIN). They transmit from Silver Spring, Md.. Signals "carry text,
/graphics and satellite photos to anyone who has a personal computer, a $60
/police scanner and a special $150 hardware and software kit."
/
/Sounds interesting, perhaps take the audio from the scanner and try to decode
/the data sent. Now to find the frequency.
/
/Any ideas?

Yes!

There's a new program called WeatherMan which will decode Weather fax
with a sound blaster board. There's an older version on "oak.oakland.edu"
in the ham radio/digital area. Or you can write the author Paul Hitchcock
at "paulhtc@netcom.com". I don't think a scanner will work unless you
can tune to a sideband and adjust the BFO.

Sorry Nope.....we usually use Farnells or RS Components for
stuff like this but looking at the price they will be about the same
as Maplins, soreeee.

Farnells price for 400ml Electrolunbe RFI screening is 15.72 plus
VAT. If your in our area bob in - we can spray whatever you
have for you if you wanted.

: a wide array of frequencies (even heard it can do 1khz to 1300 mhz?)
: and maybe even transmit there, but I don't see a reason for that..

Uh, that would be a neat thing to be able to do, but the Alinco DJ-580 isn't going to do it for you. Rx (with the Red wire mod) is about 110-174, 400-520, and 810-999. Each unit will vary a bit on the edges (whether the PLL will operate or not). There is an out-of-band Tx mod also (blue wire), but I strongly advise against it unless you really have a business being there.

If you are looking for a DC-Daylight receive, consider the ICOM R-1, or one of the high-end scanners. If you also want to transmit, ICOM used to make a two-antenna model (2SRA?) which had a real scanner and a real 2meter tranceiver bolted together.

Still, having said all that, the Alinco 580 is a good moderate-to-high end Ham tranceiver. I have one, and it works well for me.

> often found on vhf CLEMARS.

I stand by what I said: Neither CHP nor any other agency routinely uses
CLEMARS for intra-agency comms... which is what I thought was the original
topic of discussion (CHP aircraft to CHP ground).

That they *can* access CLEMARS easily, and that they *do* use it for
inter-agency comms, was not a point of contention. (I've heard CLEMARS used by
CHP, SDPD, SDSO, and other locals during many late-night chases... including
one that went all the way from the LA area to near the border; I was driving
south on that same stretch of I-5 at the time and being damned careful not to
come anywhere close to catching up to them, thank you very much!)

> Aircraft on the Blue or Ivory frequencies can be heard quite a distance
> working CHP cars on the ground. If you hear the cars, you know you are
> close.

Yep.

From: petrova@yvax.byu.edu
Message-ID: <1994Dec5.145212.10743@yvax.byu.edu>
Source record: 264600

I am looking for SW reception performances of AOR AR8000 as compared
with Sony ISF-PRO 80 or other Sony or Grundig receivers.
When I call ACE and ask about AOR AR8000 they suggested me try Trident
TR3800. Daes anyone have any opinion(s) or information on Trident TR3800 and
TR4000 scanners?
I woul like find some information on TR3800 and TR4000:
1. sensitivity,
2. selectivity,
3. IFs,
4. tuning increments,
5. VFO control (?),
6. who manufactured.

Does anyone have documentation on the protocols used on trunking?
Modulation types? Message formats? error correction? Data transmission
rate? How is access arbitrated?

Does it vary by manufacturer? If so, what changes? what is consistent?

Is there a box which can decode and follow trunked subgroups?

Just got a 1995 Scanner Master catalog and they will be offering a new, improved 3rd edition of Monitor America. Looks like they'll now be including Amateur Radio repeater and AM/FM broadcast frequencies and PL tones (where possible). $29.95

They're also planning to offer state-only versions for $5.95 or $7.95 (latter are the big states).

I called and it won't be out until Feb/Mar 1995 but they are taking orders now. (Of course, they will not bill until it ships.) I do not work for or have a financial interest in Scanner Master - just a satisified customer and user of Monitor America.

From the catalog in may hands...

6399. Mods for BC890, PRO-2036???

Newsgroup: rec.radio.scanner
Date: 1994-12-05 23:00:22 UTC
From: tnorris@ulibnet.mtsu.edu
Message-ID: <3c0626$9sn@isdnlin.mtsu.edu>
Source record: 264597
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have asked this question several times in the past couple of months,
but have not gotten ANY response.

Are there any mods for the Uniden BC890 or Radio Shack
PRO-2036 scanners? Ther have been several refences to
these scanners being modifiable, but no details on the actual
modification.

A company called "Cellular Security Group" advertises in Popular
Communications and lists both scanners as being "restorable".
They want $40 to do it....

Any ideas, guys?

(of course this is for use around the commo shop as a test receiver,
not to actually listen to phone conversations, etc......)

Email any help you may have.

Thanks!

Get Bill Cheek's Scanner Modification Handbook, which has all sorts of useful stuff, including that modification you seek. Get Volume No. 2, which is the most current. He can be contacted at:

Commtronics Engineering
PO Box 262478
San Diego, CA. 92196-2478

Or call his BBS at 619.578.9247.

By the way, to all those people who are asking how to connect a computer to a scanner, his CE-232 interface unit is the way to go. It has awesome capabilities.

Hope that helps.

This message is not to flame you, it is just a message replied to and what needs to be said. I agree with you in your message. I just needed a reference point for my message

I spent 9 years of my life working as a 911 operator / dispatcher for New York City Police Dept.

I loved what I did, I enjoyed the people I worked with. The job also nearly killed me. It killed numerous employees.

No one knows what a dispatcher/operator goes through. No one knows unless you are there listening to all of the calls.

Callers who refuse to give you information like the apartment number in a 20 story building. Or a description of the man with the concealed gun. They just say the police will know when they get there. The lying public who wants the car there faster because a person is urinating on the building so a police officer shot is called in. Parents who are screaming at children call the police to take away their child because their child refuses to go to bed on time. People who stub their toe and want a police car rather than asking a friend to take them to the hospital or a taxi. They call over and over again to take them to the emergency room and a child choking call has to wait because ambulances are not available.

These are some of the calls we go through. In addition to the calls where you try to talk a teenager into giving an address because the teenager has failed math and wants to commit suicide. Or talking to the person who has just reached the phone during their heart attack and a trace has to be activated. Enhanced 911 is not available in NYC as of yet. So the operator will stay on the phone during the entire call trace. It can take as long as 4 hours. And the operator cannot take a break because they might lose the caller. Yeah it is part of the job, but people do want to go to the bathrooms.

Imagine talking to people who are being held hostage and you get the caller who manages to get to the telephone. Or talking to the person who is in the room where the fire is burning uncontrollably. Or talking to someone who is being shot at in the street. Ever talk to someone and their head is blown off and all you hear after the gunshots is "dangle, dangle".

Well this is what some of us go through.

You are right, go after the perps, not the people who answer the calls. Not everyone is rude on the phone. 911 personnel go through hell. And listen to it daily. I have spoken to kids who were raped. One 12 year female who was raped who gave me a description of her rapist then screamed into the phone "HELP ME" caused me to go bonkers for a long time. Nightmares and then when the cats were yowling in the yard, it sounded like her and it haunted me for months. That was when I decided to quit. I was burnt out and could not do my job.

911 operators in municipalities are some of more stressed people around. A high burnout rate and a high drinking rate. Yet who cares enough to say to 911 operators who give up Christmas and Thanksgiving and their kids birthdays and anniversaries, thanks for being there.

How many who will be reading this message will be saying thanks for being there.

6408. Belt Clip on 43

Newsgroup: rec.radio.scanner
Date: 1994-12-06 00:35:24 UTC

Dear Santa,

My name is Christopher Seburn, I am 3 1/2 years old. I have a brand new little brother named Bradley that is only 3 weeks old, and I love him very much!

I have been a very good boy this year, and from now until Christmas I'm going to be EXTRA good, just in case.

Some of the things I'm hoping to get for Christmas are:

- An orange big boys bike (two wheels)
- "Gator Golf" golf game
- Some Lego building blocks

Those are what I'd really like. I'd also like to know if you could bring my little brother a few baby toys, he's to small to play with most of mine, and I'd like him to have some of his own to be able to play with.

Say hi to Mrs. Claus, and all the Reindeer for me too please.

Thank You VERY VERY much, and have a safe trip delivering all the toys!

Love Christopher & Bradley Seburn

I was in K.C. in early fall and had a long talk with the capt. in charge of communications while my co-workers were interviewing the chief...she said it would be well into 1995 before the switch is made...they apparently requested the freqs. but because of $$ can't make the switch for a while...hey you could be in New Orleans where they don't even use repeaters.

I am interested in mods for a Realistic Pro 2003 scanner,
I have been unable to find any ? In particular the disabling of the beep
and speed increases are of the most interest . Any assistance would be
appreciated . Thanks. kfisher@freenet.edmonton.ab.ca.

6416. Need opinion on Bearcat 8500XLT-K Scanner

Newsgroup: rec.radio.scanner

I just say an ad for the Bearcat 8500XLT-K Radio Scanner from Communication Electronics for $368.95. Does anyone have any experience with this scanner or Communication Electronics??

I understand this scanner although skips the 800 band but it can pick it up at 400Khz above the actual. Any thoughts is apreciated.

Jeff

You might want to pick up a copy of the most recent consumer reports magazine...they just rated batteries. If I remember right, they said the batteries rechargeable alkalines were okay for certain applications, and poor for others.

Check out the article.

Does anyone have data on the protocols used by numeric and/or alphanumeric pagers (Motorola type), perhaps even software that can be used to decode the data? I was thinking that one could hook the audio output of the scanner into the A/D converter of a SoundBlaster card to decode the stuff.....

Find a dealer that sells the AOR/Trident/Camnis/Fairmate radios. Order an extra belt clip from their parts department. It's a long metal clip that has properly spaced holes for the PRO-43. My original belt clip is in the drawer, and I didn't even wait for it to break.

The 8500. Is that the handheld portable?? If so, read on...

Recently, about 25 radio amateurs in our area, including me, met for our usual Tuesday evening coffee clutch at a local restaurant. As usual, everyone brought their latest handheld transceivers and other toys. It's all quite amusing to the non-hams. Twenty or so people noisily conversing while they all have their HTs blaring. Quite a little nerd society. ;-)) We practically own the restaurant, so what can they do?

One guy had the latest Uniden Scanner (the best one they make, the 8500, right?). Anyway, many of the amateur handy-talkies also receive well out of band. About 5 different HTs, including the Uniden 8500, were set to the Milwaukee Fire Dept dispatch freq of 154.385 Mhz. While all the amateur tranceivers (including some radio shack scanners) were nice and quiet when the dispatcher was not transmitting, the 8500 would frequently chatter with noisy and annoying intermod from a near-by paging transmitter.

The person who purchased the 8500 was rather annoyed with it's suseptibility to intermodulation distortion which, in his opinion, made it virtually useless. This was all with the stock rubber duck antenna inside a building.

I assume that you are probably referring to a 1/4 wave vertical antenna supported over a conducting ground plane surface. This antenna has a radiation pattern just like a 1/2 wave dipole. The ground plane creates an image antenna, the other half of the 1/2 wave dipole. The impedance of the ground plane antenna is 1/2 that of the regular dipole, which would be about 35 ohms with some inductive reactance.

Its benefit is that you can get performance like a dipole, but you only have to put up with half of the physical height. Also, if you have a metal structure that would interfere with the vertical dipole, you can use it to your advantage as a ground plane (like the roof of a car).

Sometimes, instead of a 1/4 wave element, a 5/8 wave element is used, which theoretically concentrates the radiation pattern on the horizon for maximum range.

These antennas are typically used at VHF and UHF, because at lower frequencies, the required ground plane gets rather large.

Hope that helps, Dale

>Instead of puting the micro jack into the tape player... put it into the ear
>phone out of your scanner... put the switch on PLAY and youre in business.
>---Greg

I just broke my telephone tape recorder adapter by sending a tape recorder signal through the micro jack to try to play a portion of a tape to a friend on the other end, even with the switch on play. I am unclear about the purpose of the play switch, but I think it is for when one plays back the recorded call--because it frees up the record control plug and allows the tape player to operate--yes, that is it. This reverse signal attempt ruined my unit. I won't try it with my new one.

The 8500 is a base tabletop scanner. You're probably talking about the 2500.

>The person who purchased the 8500 was rather annoyed with it's suseptibility
>to intermodulation distortion which, in his opinion, made it virtually useless.
>This was all with the stock rubber duck antenna inside a building.

So this is the trouble with the 2500!?! The 8500 may or may not exhibit the same problems. The 2500 is double conversion (I think) and the 8500 is triple conversion and so doesn't have as many image problems.

I have the 8500, while it doesn't have the image problems of double conversion receivers, it does lack a little in sensitivity, which might account for the lessened acceptablity to images and IM.

Best Regards, Keith

I bought mine from Tucker Electronics, and I sent it back yesterday. I never bothered to try to pick up cellular on it (they're boring), but one can program everything else in the spectrum into it. I sent it back because alphanumerics and CTCSS tones can only be programmed on the first 250 channels. All the mail-order places fail to mention this. I have to admit that I really liked the radio, but the shortcoming described caused me to send it back. I'm waiting for the next model. Any questions, feel free to email me.

It isn't on the net, but the North Carolina EMS BBS (704-637-6906) has a very large collection of North Carolina frequencies. The BBS is setup for firemen and emergency personal, but is open to everyone. The frequencies are grouped by counties, and cover all of the services. BBS useage is limited to 30 min. per day. A good place to start your collection. Till later, Si B.

Reguarding the message sent to Santa here a day or so ago. I do appologize for it ending up in the wrong place. It was sent using a offline QWK reader, and for whatever reason the host system on this end sent it too this newsgroup, instead of Email. I double checked my files and they were fine, and a second posting via the same .REP packet, resulted in the message being sent to the correct Email address. It was a system error, not mine.. and I'm sure doesn't require the flame I have already received. I was waiting to see if it was indeed posted here before I said anything. If anyone can tell me how to stop a post from being sent out, when I see it being posted to the incorrect group ever again.. I'm all ears, cause I would have loved to have stopped it.

Thank you Brian..

>
> Thanks in advance,
>
> Steve
>
The PRO-2035 is the replacement for the PRO-2006. I own a 2006
and I am very impressed with its performance and ease of modification.
However, in order to comply with Federal laws concerning the monitoring
of cellular phones, the 2035 is suppose to be unmodifiable. The
cellular phone bands are permanently locked-out and cannot be restored.
While I have not had hands-on experience with the 2035, I have read
a review on it in Monitoring Times (Oct '94) which says that its
performance is equal to that of the 2006, plus it has the advantage
of 1000 channels, a VFO, and a "search and store feature."
If the cellular phones are not important to you, you should seriously
consider the 2035. However, if you want to monitor the cellular bands, try
to find a used 2006.

6451. Re: pager scanning

Newsgroup: rec.radio.scanner

From: hrick@news.gate.net
Message-ID: <3c3e8s$234d@hopi.gate.net>
Source record: 264553

Wouldn't it be rather boring to monitor the signals going to numeric
pagers? I doubt that the alpha-numerics are much more fascinating --
"call office" or "meet drug dealer at corner payphone" mostly.
Anyway, if you closely watch the magazines such as Popular Communications
and Monitoring Times, you will probably eventually see an ad for gear
to monitor that sort of thing. If not, make friends with some
technicians who work in the paging industry.

6454. Alinco DJ580T "tone frequency decimal point"?

Newsgroup: rec.radio.scanner
Date: 1994-12-07 05:16:07 UTC
From: mc2@alcyone.darkside.com
Message-ID: <k67Xwc1w200w@alcyone.darkside.com>
Source record: 264555

I just got myself an Alinco DJ580T, which I'm very pleased with, but I have question concerning its operation.

On p. 19 of the manual, it reads "When the Tone frequency is displayed, the decimal point divides Hz and 0.1 Hz." This "tone frequency decimal point" appears, though, one digit to the right of the "frequency decimal point," which divides 1 MHz and 100 kHz. Schematically, if reading a 500 MHz signal, normal displays as

5 0 0.0 0

but when the tone frequency decimal point is active, which is only on certain channels at certain times, 500 MHz would appear as

5 0 0.0.0

but the second decimal point cannot possibly divide 1 Hz and 0.1 Hz. My only guess is that the tone frequency decimal point is related to a tone squelch, but even then I don't understand the reference to the 1 Hz to 0.1 Hz dividing line.

Can anyone help me out here? Thanks.

mc2@alcyone.darkside.com

>someone is getting beat up. 911 op calls the cops. Job done.

I totally agree with you, these dispatchers are under alot of stress,
where errors can cost lives. As this incident proved. If they had called
an officer to the scene after the first call, those kids running around
with bats would have been off the streets for a couple of hours, instead
of killing someone.

From the reports I got, the dispatcher did NOT CALL THE COPS. Please
correct me if I am wrong.

The cost of buying from Johnathan is about the same as buying
from the USA. It is much faster though. He dosn't fool around
if he has the stuff in stock it goes out immediately express ups
delievery guranteed second day. The only reason I didn't get it
Sunday is UPS dosn't deliever Sunday.

No the cost of the radio was $612. The computer interface and and extra
manual was the rest. I will send a message tommorow regarding observations
of this complicated radio. At first I didn't like it. But after
using it all day yesterday my oinion has changed and especially
after I reread the manual last night.

IMHO the manual could have been done much better then it was.
You don't find out how to make it scan until page 60 !

I have got to run
Brett, I have to go to south Ga. today.

Oh hi,

I am now positive that there is some keyboard sequence to expand the range to 25 - 1300 mhz. (It is 50 - 905). I have hacked the hardware as much as I have been able to figure out (with aid of the service manual) and got the display to register from 25 -1300 mhz, but when I enter a freq below 50 or above 905 it switches to a different tuner section. How have people discovered the keyboard sequences for other (any brand) scanners?

Source record: 264566

I talked with an exec at Uniden and he found out that the BC9000XLT will still only have up to 250 alpha-tagged channels. They claim that there isn't enough memory to have all 500 channels alpha-tagged.

The BC9000XLT will still use accomodate the optional BC005 PL board.

Other additions are Data Skip during Scans or Searches, 300cps during VHF-Lo or VHF-Hi Searches, Attenuator function, Hi Cut feature, switchable modes (NFM, AM, WFM), and the ability to lockout up to 50 freqs during a Search. Also, I believe that you can plug in a pair of stereo earphones/head-phones and hear out of both ears. <g>

The one thing you lose is the ability to use Priority during a Search.

The BC9000XLT is due next month.

Johnson, GE, Motorola, etc. all use their own protocols.
As far as I know, they don't publish the specs (unless you could get some kind
of service manual).

I have heard that there is a company working on a box that will track trunked
systems, but I don't think such a product is currently available to the public.

>Pat Prather

Pat,

One of the constants of our hobby [and most others] is no matter what equipment you start with, you will probably "buy up" to something bigger, better, stronger, etc. within a short period of time. We are always adding new stuff, either receivers/scanners with broader coverage or features, or antennas, or ...

So, first decide what it is that you want to listen to in your area and get the best radio that you can afford that meets your needs.

You didn't specify if you want the unit at home, or in the car, or handcarried, or ... all of the above. See, it all makes a difference. Don't forget a good antenna and a book or two to answer many of the basic questions as well as providing some starter frequencies.

Good luck and good listening ...

Pres

6471. Portable Scanner Recommendation?

Newsgroup: rec.radio.scanner
Date: 1994-12-07 16:59:43 UTC
From: jdangel@denali.ccs.neu.edu
Message-ID: <3c4plv$dv9@chaos.dac.neu.edu>
Source record: 264572

I want to get a portable (handheld) scanner that can receive:

- Air band
- 800mhz (cellular has to be restorable)

And the big one: Cheap.

I have seen adds for the Realistic stuff. I owned a Pro2004
for a long time and loved it. Are their handhelds as good?

Thanks! Jeff

6472. Uniden Sportcat SC-150

Newsgroup: rec.radio.scanner
Date: 1994-12-07 17:14:05 UTC
From: neilberg@deepcove.com
Message-ID: <3c4qgt$ado@Kaos.deepcove.com>
Source record: 264626

Hello, I have a few questions to ask, if I may. I have an Uniden Sportcat SC-150 and access to a SC-200. I got myself into a bit of trouble a couple of days ago but managed to get out ok ... but lost all my channel memory in the SC-150. My questions are simple, what combination of keys did I hit to get where I ended up and are there any other key strokes I should know about that would get me into trouble? I know the inputing practice is good but I'd like to know before I do it. Also are these models upgradeable to opening up the locked out channels?
Thanks, Neil

6473. Bob Parnass Joins MT

Newsgroup: rec.radio.scanner

<SNIP>:
: Thanx a lot...
: Pat Prather

Well my first thoughts are about your friends scanner. Was it in your price range? Did it have features that you liked/disliked? This should play into your choice. Was it a hand-held? Did you ever find yourself asking things like:

I wish the battery lasted longer?
or
I wish this could do this or that...

You have had a free trial of that model and a chance to find out that you like it before laying out any cash...

I suggest you read the Intro to Scanning posts and the info on the various models available. Good Luck and Happy Scanning...

TOM>>I have asked this question several times in the past couple of
TOM>>months, but have not gotten ANY response.
TOM>>Are there any mods for the Uniden BC890 or Radio Shack PRO-2036
TOM>>scanners?

Yes.

There are several modifications for these units.

Maybe if you were specific in what you wanted your unit to do that it
doesn't do now, you would get appropriate responses.

: >alternitives? What solutions have been used?

: Find a dealer that sells the AOR/Trident/Camnis/Fairmate radios. Order an
: extra belt clip from their parts department. It's a long metal clip that
: has properly spaced holes for the PRO-43. My original belt clip is in the
: drawer, and I didn't even wait for it to break.

If you're cheap, creative, and/or desperate, a serviceable clip can be
fabricated using a coat hanger and two eyelet crimp connectors. I rigged
one up to hold my PRO-43 at the last airshow. That was three months ago,
and I haven't had to replace it yet.

Bend the coat hanger in a "U" shape. Mine looks sort of like this:
(Warning: crude ASCII art follows!!)

```
| |
() () <-- Crimp connectors (eyelet style)
\\ //
| | The top part is angled so the crimp
| | connectors don't slide up, down, or
| | off of the wire. (You could conceivably
| | solder the connectors to the wire after
| | scraping the wire bare and crimping the
-------- connector on it.) The two top parts
```

extending past the connectors should be covered with electrical tape
or something similar so they don't scratch the radio (or you). If you
can get the bend just right, they'll rest against the radio case and
provide a bit of spring action.

Screw the connectors to the radio using the existing screws, then bend
the hangar to shape. Crimp the connectors on and you're good to go
until you can get that nice shiny metal belt clip.

I thinking about asking for a scanner for x-mas, I need some help on what to look for.

It would be probably purchased at Radio Shack, so I'm looking at their models.

Some questions:

1. What is IF conversion, and what is the difference between double and triple conversion?

2. Most of Radio Shack scanner don't carry the 200-400MHz band. Will I miss out on much if I get a scanner that doesn't include those frequencies?

3. Where are the Weather Service Bands located?

Thanks for any info,
mike

Thanks to all who replied. The shield frequency is 257.4 MHz. It's probably just a coincidence, but it is interesting that 257.4 MHz falls within the range of frequencies allocated (in the USA) to military aircraft. So I guess that Starfleet really is a military organization. Oh well, I'd better get back to reality now.

Mike,

This may not be exactly true, laws may have changed, but
basically having a scanner in the car or on your person is a no no
execpt if you are:

policeman,fireman,a goverment official,a news reporter, or
a ham radio operator.

Like I said this may not be the exaclt law but it came from a
law student who was a scanner enthusiast.

btw, he got his ham radio liscence just to get around the laws...

I suggest if you don't have your HAM liscence to go ahead and get it.

I am trying to make a transmitter for the televisions in my house. I am never in my room but I always want to listen to my stereo. MTV doesn't seem to appeal to me. We have TV's all over the house and...

MY IDEA:
I am going to make a low power transmitter to transmit in the upper 700MHz my stereo output so that I can just turn any TV close to me to channer 67 or whatever frequency I can use. Our cablevision stops at 44 other than showtime (68) and I know the sound part of channels something to 69 is 512MHz to 812MHz. It'll be closed captioned (obviously). Does anyone know any specific frequencies of those high channels and does anyone know how to get such a crystal for that frequency? Thanks.

REPAIR TIPS: BEARCAT SCANNER RADIOS |

Copyright 1993, 1994 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction |

The original Bearcat scanner line was manufactured by |
Electra of Cumberland, Indiana. In the mid 1980s, Uniden |
bought out the Bearcat scanner line and Uniden's first |
Bearcat scanner was the 800XLT model. |

Most of the models discussed in this article are |
base/mobile units made by Electra during the 1970s and |
1980s. Electra stamped all of its scanners with a |
manufacturing date code on the rear of the cabinet. The |
code is comprised of a single character (C = Cumberland, |
Indiana, P = Puerto Rico), followed by four digits denoting |
year and week the radio was built. For example, "P8422" |
denotes the radio was made in the Puerto Rico factory |
during the 22nd week of 1984.

Schematics and Parts Available |

Schematic diagrams may be obtained from Uniden/Bearcat's |
parts department, (317)842-2483. |

G & G Communications (telephone 716-768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands. They are located at 9247 Glenwood Drive, |
LeRoy, NY 14482. |

Electronic Repair Centers in Franklin Park, Illinois | (telephone 708-455-5105) has been repairing Bearcat | scanners for several years. They charge a flat $45 repair | rate for programmable and $30 for crystal scanners, and | shipping is extra. Electronic Repair Centers will fix | Regency scanners if they can obtain the parts. |

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, | BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem. |

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In two of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer | failed, causing the output of the supply to drop below the |

level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V * capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I recently replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated | IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden. |

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. | Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times. *

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints. |

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a | flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem. |

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition. |

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, | e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board. |

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem. |

Other Problems

Complaints of low audio output and occasional microphonics | in a Uniden/Bearcat 800XLT was caused by a bad 47 ufd

electrolytic capacitor in series between the external
speaker jack and audio amplifier.

from the FAQ

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

6494. Re: Pro 2006 Mod

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it unlawful to monitor mobile telephones, including cellular. The following modification is intended only to restore continuous 760-1300 MHz coverage as originally provided by the design of the PRO-2006 microprocessor.

BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THIS MODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear cabinet screws holding the upper cover. Lift off the upper cover, being careful not to stretch the speaker leads. Examine the inner, right-hand-corner of the front panel to find two glass diodes, labelled D503 (upper diode) and D502 (lower diode).

Using the clippers, very carefully snip the visible lead of the lower diode (D502) at its bend and slightly separate the cut ends. If it is ever necessary to send the radio back for warrenty repair, the diode leads should be carefully resoldered.

Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete

With the top cover removed as described above, locate connector CN3, a 15-pin connector with colored wires at the front of the main circuit board. There are two precedures which will stop the beep tone from being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beep tone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3, revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit.

Reinsert the plug. The pin may be erected again later to restore the
beep tone if desired.

This completes the restoration procedure. Reattach the cover and replace
the screws.

WARRANTY REPAIR

Should it be necessary during the first year of ownership of your new
PRO-2006 to exercise your warrenty, it should be carefully double-boxed
(as you received it) and returned to Grove Enterprises. Be sure to
include a copy of the original bill to establish warranty
privileges.

You must prepay only shipping and insurance; return shipping and
insurance to you will be paid by the dealer.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

|> Any side-effect? A guy from Marymac told me the mod
|> increases scanning speed significantly.
|> nvn

There are two diodes behind the "3" key on the keypad.
Clipping one restores cellular, clipping the other
increases scan speed by about 13%. I did this to my
Pro-2006 after the warranty expired and did indeed measure
a 13% scan and search speed increase. I don't think
this has had any adverse effects on the radio although
its theoretically possible that the increased scan speed
might cause the radio to miss some carriers - but this
is purly speculation on my part.

Cheers,
Peter

>CRYSTAL FASTER THAN 12 MHZ IN THE PRO-2006?

Yes, I have done the Crystal mod. I used a 16.630 MHz crystal from an old
cordless phone (no bull), and I got a big speed increase (approx. 46 channels
per second). I tried several different crystals, ranging from 16MHz to 39MHz,
and my results seem to indicate that the highest crystal freq. should be about
18 MHz. If the crystal is too fast, the 2006 just uses the 3rd harmonic (ie
a 39MHz crystal operates like a 13Mhz.)

From: ross@novax.llnl.gov

>>The Scanner Mod Handbook #2 says to replace the 12 MHz crystal with something
>>faster; however, the author, Bill Cheek, says he hasn't actually tried it. I
>>haven't either, although I'd be interested in knowing if it is a successful
>>mod.
>

Well gang, right after I got my Mod handbook 2, I tore into my 2006. At first I
tried a 20 MHz xtal, the processor locked up and not all the LCD display
segments were happy (I had already done the diode clip speed mod). So I tried
an 18 MHz xtal, same problems. I contacted Cheek (the author) and he reported
that 16 MHz was the safe upper limit as he had seen no lockups at that speed
and higher speeds had produced lockups on SOME units.

So I changed xtals again. The 16 MHz runs fine without any loss of sensitivity
and I find enough delay left to still be able to use it (a faster
microprocessor xtal shortens delay time).

My favorite 2006 mod is a wired remote control (Monitoring Times Aug 91 - Bill
Cheek). I added a few extra parts and can control the following functions from
a six foot detachable cord: Scan, Manual, Search up, and Search down. Searching
is a snap when you can't reach the keyboard or it is dark.

Gary

From: horak@eugene.convex.com (David Horak)
Subject: RE: PRO-2006 Scanning Speed Mod.

Well, I changed the crystal in my Pro34, which is the same type of crystal and harder to get to than the 2006; however, I haven't changed the 2006 crystal yet. Some of the following instructions come from the Scanner Mod Handbook Vol. 2 on removing the logic board. Please read it all before doing anything. If you royally screw up your scanner, IT IS NOT MY FAULT!!!!!

Before you start anything, make sure you are at a static safe workstation. Unplug the A/C power cord. Remove the top and bottom covers. Remove the 4 countersunk machine screws from thesides of the front panel, then gently pull the panel away from the main chassis. All wires and cables will have to be disconnected from the top and bottom of the logic board (the board that the crystal is on). This will cause your memory channels to be lost and you will have to reprogram them :-((If you can work around it, you could leave CN-3, a 15 wire connector, connected to save your memories). At this point you may have to desolder a ground wire from the chasses going to the bottom of the logic board metal shield. Next, remove 6 small screws that secure the logic board to the front panel. Then, face the inside of the front panel placed in an upright position and locate the white 13-pin connector (CN-501) at the upper left corner of the board. This connector doesn't have any wires, just metal pins going into it. Gently pry this connector apart with a small flat blade screwdriver and the board should slip away from the plastic front panel and come loose in your hand. Also, you may need to remove the volume and squelch knobs. Desolder the metal shield at six places around the logic board and lift it up and off the board. This is fairly easy to do with a low wattage soldering iron. Apply pressure with your fingers while the shield is heated at each leg. As the solder melts, that leg of the shield will slip upward and pop free. Now there are two choices. If you have an air sucking soldering iron, you can procede to desolder each of the three leads. If you have a normal iron, this will be impossible. The remaining choice is to crush the crystal with a pair of needle-nose pliars until only three leads remain sticking up off the board. Then you can heat and remove each of the three leads. The center lead is ground. You will only use the outer two leads when installing the new crystal. It would be a good idea to insulate the body of the crystal with shrink tubing (whatever you do, don't use electrical tape!) to avoid it shorting out to another component. The crystal will have to be bent over so that the metal shield can fit back on top of the logic board. Before you completely hook everything back together, get the scanner in a usable state and make sure it works. It would be a real bummer to tear it all apart because something is wrong.

Hope this helps,

David

alt.radio.scanner
Subject: Pro2005/6 SSB MOD HERE!
From: horak@convex.com (David Horak)

Date: Mon, 31 May 1993 18:04:59 GMT

I had a few requests for this mod so I thought everyone would benefit...

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

Just having an antenna would not be enough to make you suspicious.
How do they know you might not be using CB or HAM. I have seen cars on the
road with dual CB antennas.

Newsgroups: rec.ham-radio
Subject: Review - The New Radio Shack PRO-2005 Scanner

THE RADIO SHACK PRO-2005 PROGRAMMABLE SCANNER
by Bob Parnass, AJ9S

Manufactured in Japan by General Research Electronics, the Radio Shack PRO-2005 is a 400 channel, wide coverage scanner radio, incorporating NBFM, WBFM, and AM modes. It is the successor to the PRO-2004, the super scanner which put Radio Shack out in front of its competition in the base station scanner market.

The 2005 is basically a 400 channel PRO-2004, built using surface mount components, and housed in a smaller package.

Frequency Coverage

Radio Shack's last minute decision to remove cellular telephone frequency coverage from the PRO-2004 caused a 7 week delay in its introduction. The PRO-2005 appeared in the stores promptly on the heels of the 2004 closeout sale. Both the PRO-2004 and PRO-2005 cover 25-520 and 760-1300 MHz, except for 2 gaps in the cellular telephone bands. The two gaps in the 800 MHz range can be restored in either scanner by clipping a diode.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2005 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

The PRO-2005 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable rescan delay, an external speaker jack, etc. But, the 400 channel

capacity of the PRO-2005 sets another an industry record, just as the 300 channel PRO- 2004 did! Casual scanner users may scoff at the usefulness of having so many channels, but seasoned monitorists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2005 memory is backed up by a conventional 9 volt alkaline battery (not supplied). The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2005 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2005 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2005 has two scan speeds, approximately 8 and 16 channels/second, although one would probably use the fas- ter speed in most instances. This is the same speed as the stock PRO-2004, as measured by your reviewer. A diode could be added to the PRO-2004 diode matrix to speed up the scan and search rates by 25%. The provision for extra diodes in the diode matrix makes one hopeful that the same speedup trick can be applied to the newer PRO-2005.

When programming a channel, the PRO-2005 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a NBFM satellite in the 225-400 MHz range, which is mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2005 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any of the conventional 400 memory channels. One can set up several search pairs, for instance:

- 46.610-46.970 MHz: cordless telephones
- 144-148 MHz: the 2 meter ham band
- 30.01-30.56, 32-33, 36-37 MHz: US Govt

Another unique feature is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO- 2005 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO- 2004, there is a hidden step size of 30 kHz, but apparently this step size was disabled when the cellular telephone frequency coverage was removed.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004. Search speed is switchable between slow and fast, with fast search being about 14 increments/second (versus 12 for the Uniden/Bearcat 800XLT). For a 12.5 kHz increment, this translates to 11.2 MHz/minute (versus 9.6 MHz/minute for the 800XLT).

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2005 searching upwards from 460.100. This is a nice feature.

The PRO-2005 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2005 have this problem.

The PRO-2005 includes a SOUND SQUELCH, resembling the VSC circuit on the Icom R-7000, which may be used during scan or search operations. With the the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", or link signals with a constant carrier. The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2005 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop

the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature head- phone jack on the front of the scanner.

The PRO-2005 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2005 was compared with it's father, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2005 proved moderately more sensitive than the PRO-2004 on most bands tested, and just slightly more sensitive on a few bands. The cost one pays for the 2005's increased sensitivity is having to put up with hearing 800 MHz trunked systems and cellular telephone conversations while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard only on the 2005, not the 2004. Other than that, intermodulation interference from paging affected both scanners to the same degree, and on the same frequencies.

Although both the 2004 and 2005 can suffer the effects of intermod, they are much more immune than the overly sensitive, image laden Bearcat 800XLT. The PRO-2005 has a 10 dB attenuator, operable by a slide switch on the rear. The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2005 allows use of a very high IF (inter- mediate frequency), which helps avoid image problems. The PRO-2004 owner's manual contains a frequency allocation chart and a section on images. This section appears in the manuals for other Radio Shack models, and was thoughtlessly thrown into the 2005 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2005.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an external speaker would allow the sound to be directed at the user.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a different setting of the volume control. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2005 squelch control has a wee bit too much hysteresis, a trait inherited from its ancestors. It's like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. It's not as sloppy as in the early PRO-2004s. I've successfully eliminated this problem completely by replacing a single resistor on the 800XLT, as well as the PRO-2002, PRO-2003, PRO-2004 and PRO-24 scanners.

Mechanical Construction

The PRO-2005 is lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $420, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2005 vertical front panel is an advancement over the sloping panel of the 2004. Now you can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a good viewing angle.

There is a single BNC antenna connector on the rear of the PRO-2005, and a single telescoping antenna is supplied.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2005 owner's manual lists the birdie frequencies. The shielding is much better in the PRO- 2005 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch.

Vision impaired scanner buffs will appreciate the conventional raised rubber keyboard in the PRO-2005, which replaced the flat membrane keyboard in the PRO-2004. Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2005 is the right size to fit under the dashboard of intermediate sized cars. Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is outstanding compared with the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is not current. There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $7.50 or $10.00.

The PRO-2005 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2005? A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

Summary

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2005. This scanner is for those who enjoy actively exploring voice communications in the VHF/UHF spectrum. If you already own a PRO-2004 and have added the diode to expand it to 400 channels, there is little to be gained by purchasing a new PRO-2005 -- unless, of course, you are a passionate scanner collector.

The PRO-2005 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band. Good design should not to be taken for granted. GRE engineers used the power of the microprocessor to implement useful features in the PRO-2005. Similar processing horsepower was not used so wisely in the Yaesu FRG-9600.

At about $420, the PRO-2005 provides a good alternative to those not wishing to spend $1050 for an ICOM R7000.

Lines: 29

Hi all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional mobile
telephone conversations.

The 2026 has cellular frequencies deleted at the factory, but
restoration is the easiest ever! - clip one marked wire! All you need
is a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws
holding the bottom cover in place; pull the cover loose and set it
back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand corner and
find jumper L201. Cut it and slightly separate the break.

3. Reassemble the radio which now has continuous 806-956 MHz coverage
and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from a
commercial radio dealer who is very respectable, so as always, proceed
at your own risk and realize that this will violate your warranty!

Have Fun!

HAS ANYONE NOTICED?

Swiss Radio International's Relay in French Guiana has not been carrying regular programs? They have been playing recorded announcements saying the feed from Switzerland to French Guiana has been interrupted! Interrupted for four days now!

There is this great new invention that replaces a satellite feed lose, it's called a TELEPHONE Line.

I wonder if SRI is testing us? Many local stations replace programs they think are unpopular without notice and see if they get any complaints.

Swiss Radio International is the station, common sense forgot!

I bought a small bottle of nickel paint and painted the inside of the case, both top and bottom on the inside. It helped a lot. If you paint the inside of the overlapping area, it will form a good seal and it will also touch the metal all around the back. This only leaves the front panel without shielding. The front panel can be taken apart too, but it is a pain.

Hams have a band at 2304. And there's the MDS three TV channels
at 2156. Also, closed circuit school channels in the ITFS band
nearby. I once built a 2156 Mhz downconverter and watched some
interesting TV signals. -pat

The following is reproduced from Indiana Law:

35-44-3-12 Unlawful use of a police radio; exemptions; "portable police radio" defined
Sec.12. (a) A person who knowingly or intentionally possesses a portable police radio commits unlawful use of a police radio, a Class B misdemeanor.
(b) This section does not apply to:
(1) a governmental entity;
(2) a regularly employed law enforcement officer;
(3) a common carrier of persons for hire whose vehicles are used in emergency service;
(4) a public service or utility company whose vehicles are used in emergency service;
(5) a person who has written permission from the chief executive officer of a law enforcement agency to possess a portable police radio;
(6) a person who holds an amateur radio license issued by the Federal Communications Commission;
(7) a person who uses a portable police radio only in his dwelling or place of business;
(8) a person:
(A) who is regularly engaged in news gathering activities;
(B) who is employed by a newspaper qualified to receive legal advertisements under IC 5-3-1, a wire service, or a licensed commercial or public radio or television station; and
(C) whose name is furnished by his employer to the chief executive officer of a law enforcement agency in the county in which the employer's principal office is located; or
(9) a person engaged in the business of manufacturing or selling portable police radios.
(c) "Portable police radio" means a radio receiving set that is capable of receiving signals transmitted on frequencies assigned by the Federal Communications commission for police emergency purposes and that:
(1) can be installed, maintained, or operated in a vehicle; or
(2) can be operated while it is being carried by an individual.

This term does not include a radio designed for use only in a dwelling. As added by Acts 1977, P.L.342, SEC.1.

Here's the actual text from the Indiana state statutes regarding possession of a portable scanner. If you think that Indiana has strict laws, I understand that police officers in Kentucky have the authority to destroy a scanner on the spot if it's being used in a car at the time of a traffic stop. At least a bill which would have outlawed possession of scanners in my home state of Illinois was withdrawn by the state representative who originally sponsored it. It's good to see that we scanner owners still have some rights in a few places. Happy reading!

Roger Diercks
Valparaiso University
Valparaiso, IN

IC 35-44-3-12 Unlawful use of a police radio; exemptions; "portable police radio" defined

Sec. 12. (a) A person who knowingly or intentionally possesses a portable police radio commits unlawful use of a police radio, a Class B misdemeanor.

(b) This section does not apply to:

(1) a government entity;

(2) a regularly employed law enforcement officer;

(3) a common carrier of persons for hire whose vehicles are used in emergency service;

(4) a public service or utility company whose vehicles are used in emergency service;

(5) a person who has written permission from the chief executive officer of a law enforcement agency to possess a portable police radio;

(6) a person who holds an amateur radio license issued by the Federal Communications Commission;

(7) a person who uses a portable police radio only in his dwelling or place of business;

(8) a person:

(A) who is regularly engaged in newsgathering activities;

(B) who is employed by a newspaper qualified to receive legal advertisements under IC 5-3-1, a wire service, or a licensed commercial or public radio or television station; and

(C) whose name is furnished by his employer to the chief executive officer of a law enforcement agency in the county in which the employer's principal office is located; or

(9) a person engaged in the business of manufacturing or selling portable police radios.

(c) "Portable police radio" means a radio receiving set that is capable of receiving signals transmitted on frequencies assigned by the Federal Communications Commission for police and emergency purposes and that:

(1) can be installed, maintained, or operated in a vehicle; or

(2) can be operated while it is being carried by an individual.

The term does not include a radio designed for use only in a dwelling.
As added by Acts 1977, P.L.342, SEC.1.

Historical Note

Acts 1977, P.L. 342, Sec. 1, eff. Oct. 1, IC 35-44-3-11.
1977, added this section. Acts 1933, c. 66, s. 1.
Acts 1941, c. 87, s. 1.
Formerly: Acts 1972, P.L. 224, SEC. 1.
IC 35-21-1-1. Acts 1977, P.L. 26, SEC. 21.

Cross References

Sentence for Class B misdemeanor, see section 35-50-3-3.

Notes of Decisions

1. In general

This section governing unlawful use of portable police radios does not prohibit possession of a portable police radar detection device.
Wallman v. State, App. 1981, 419 N.E.2d 1346.

2. Notice

Statute governing unlawful use of portable police radios is sufficiently clear and definite to prohibit possession of portable police radios capable of receiving local police radio communications, but does not afford adequate notice to a person of ordinary intelligence that possession of a portable radar detection device violates law.
Wallman v. State, 1981, 419 N.E.2d 1346.

That message somehow got truncated. Here is some of the rest of it.

What I have noticed so far is :
>Bad
>1. VFO knob sometimes skips a bit and kind of cheap feeling. Has lots of
>popping in USB/LSB/CW modes.

Did not notice this in mine.

>2. Construction quality of the case so - so.
AGREE for this kind of money I expected a ham grade case like better HT's.

>3. Rubber duck sucks big time, and I don't mean signals.

I noticed this within the first ten minutes while driving and looking at it.
Stuck Pro 43 stock antenna on it an signal really jumped. Nice feature of
the rf indicater is you can actual look at the difference the antenna makes
on the same signal.

>4. So So reception on medium wave but adequate for local stuff.
If you are outside. Mine isn't so hot at all sitting in a car with it near
a window.

>5. Bandscope is kinda neat, but it mutes the audio while it goes out and
>checks the adjacent freqs. Haven't really decided how usefull this is.

Haven't looked at this much. Got a few ideas though to try later.

>6. The Auto step setting picks some step sizes that may not be appropriate
>for some freq. ranges. This could be a little confusing to the new user.
>
???? I thought this was a problem in mine since I bought it from Europe.
I don't use auto at all after the first hour when I noticed the radio changing
frequencies seconds after I input them to something else. This is one of the things that
got my blood pressure worked up BIG TIME. Now that I understand somethings inherient in its
design it dosn't bother me a bit any more.
I use expert mode only. The other mode is useless for my purposes.

>Good
>1. Very good keypad
Yes and no. I wonder how long it will be before the lettering on the keys wears off.

>2. Very very good audio quality and quantity for a scanner.
I disagree. I like the audio from a police ht. I like the audio from my ham ht's. I live with the audio with this radio. Every opportunity I connect it
to an amplified speaker of 7 to 10 watts max output. Now that is quanity!

>3. FM broadcast reception quite good, probably would sound good with an
>external speaker.
Agree here.

>4. Good sensitivity in the VHF bands when used with any other duck except
>the one supplied.
I am extremely pleased with it in the vhf uhf and high uhf bands. Few birdies.
How did they do that?

>5. Good selection of accessories.

>6. Respectable SW and Amateur band performance when used with any other

This later is in spades! By the end of the third day of use I can say I love this radio. No previous radio that I am aware of can do the things I can do with this bugger. I have found practical uses for many of its expert mode features that are nothing short of astounding to me. Many agrevations associated with driving and listening to a scanner are gone with this product.

6513. AR8000 (Search funtion)

Newsgroup: rec.radio.scanner
Date: 1994-12-08 12:40:16 UTC
From: <>
Message-ID: <3c6urg$1nf@news.ping.com>
Source record: 264666
Cross-posted to: rec.radio.scanner,alt.radio.scanner

My version of the AR8000 came with all banks pre programed with things
like marine usaf mil air civ air etc. Did yours? Did you check the parameters?

None of the parameters in mine were correct. I have got to conclude that in some
part of the world these may be what are used but we have a completely different allotment
here.

Last night I reprogramed a couple of banks to cover the mil from 138 to 150.50 since I live
close to Dobbins AFB. BINGO within a few minutes I heard a chilling rescue taking place
on 141.3625. I called my favorite radio news station WGST AM and tipped them to
what may be a breaking story. They called back for more information after they found they
could not program this into any of their scanners. By then the story was there had been
a refrigerant leak with six victims. Medic one ambulances were on the scene and the local
goverment Smyrna City had sent rescue 103 to assist the afb fire/crash teams. SMYRNA
actually
came up on that frequency and talked to AFB control regarding additional assistance.

I suggested that WGST contact SMYRNA for information as I didn't want them to
bother the base in a critical moment. Again they called back and said that Smyrna said it
was an exercise. By that time I also was able to determine by the nature of the radio
traffic that it was a very realistic simulation that was going to include the ER
of local hospitals etc. OK no qudos for being the first with a breaking story tonight. :>(
But at least no one was seriously injured. The last one I called in the pilot was died
and the poor fellow at WGST had to stay an extra 3 hours covering the story past
his quiting time.

Now here is a question for someone with a reference book. What is 141.3625
supposed to be used for at Dobbins AFB. I thought the crash trucks were
on 172 something. Does the government jump around to foil scanner users?

Thanks

>

I have used them all except the top of the line icom.

After four days of use nothing can beat the AR8000 period.

When you add the cost of features that are built into the AR8000
to a 2006 you will spend far more on the 2006 and still not be able to
do all the neat things the 8000 can do.

A very nice computer interface to the 8000 is $132 or thereabouts.
It is comletely portable so you can hook it to a lap top while
traveling or engaging in counter espionage. The automatic search
and store function works so well that I truely don't believe
that you need a frequency meter to locate an elusive service.
Just common sense and an 8000 and you have them as soon as they transmit.

When I first used the 8000 I was ready to send it back but now
I wouldn't be without one. If you know radio and some radio theory
this is an incredible tool.

> ...the new Percom CDRom .. Has anyone here bought one and used it?

It works fairly well on a 486DX2-66 with 8 MB of RAM
and I think it's a good buy at $29 + shipping.

In general, querying the FCC database, whether on CDROM, floppy,
or microfiche, is an art in itself. You can search for all
licensees with a transmitter location of "Oswego, IL"
but you might miss several dozen entries for Oswego transmitters
which for which the Transmitter City field is blank. That's
more a fault of the FCC data rather than the media.

Many entries specify lat/lon without a transmitter city, and
you must use the lat/lon info if you want to know whether they
are located near you. That's part of the motivation for
inventing RadioMap(TM).

Although the Percon Spectrum CDROM supports several different queries,
you cannot query for stations based on latitude and longitude.
The lat/lon info exists on the CDROM, and you can see it,
but you cannot say "show me all the transmitters within 3 miles
of 41 41 15 N lat and 88 18 33 W lon."

> What do you think about it compared to the data from
> Radio Shck in their various call books.

Both are useful in very different ways. The Police Call books contain
listings for only a small subset of stations you can scan.
It omits business and industrial stations, for instance, and
those are areas I enjoy monitoring. Also missing are transportation and
many aero frequencies, as well as common carrier, telephone repair, etc.

Police Call is great for folks who scan state and local
government stations because it contains information as to *how*
the frequencies are used, and you won't find that on the
Percon or Grove CDROMs. Some of the RCMA folks around
here contribute the usage info to the local Police Call volume.

Police Call and the Grove CDROM (according to Bill Grove) are
purposely seeded with some bogus license info to protect against
copying, but I don't know if that's true with the Percon products.

Of course, the Police Call is inexpensive, and highly portable :-)
I buy Police Call each year and recommend it as the first book

a new hobbyist should get.

As with all things you get what you pay for, so the "and cheap" part I cannot help with. As for the other recommendation, lay down your cash and get a BearCat 2500 if you can still find one. They are modifieable. To cover the 800 MHz band, the new 3000's will have this band blocked. Dealers are allowed to sell the remaining 2500's but after they're gone they're gone. Act quickly to avoid being limited.

This is one part of the hobby which makes scanning fun -- the hunt for new freqs! Some possibilities I've found by "sleuthing:"

1) They use other, non-police frequencies licensed to the town or county, like road department, tax assessor, electrical department channels. (Like Plainfield (IL) Police and Kendall County Sheriff did).

2) If they use a repeater, they use the output freq for simplex transmissions. (like most agencies do)

3) If they use a repeater, they turn off their PL (CTCSS) and use the input freq for simplex transmissions.

4) They use frequencies for which they have recently applied for or have been granted an FCC license but are too new to appear in current frequency books (happens on a continuing basis).

5) They use Citizens Band (like Kendall County Sheriff did).

6) They use frequencies without benefit of licenses or for which the license expired years ago. (like some PDs in Cook County, IL)

7) They use rented radios on business or SMR frequencies.

8) They use marine frequencies (like the "police" at Santa Fe Speedway in Willow Springs, IL did).

There are many techniques for finding them and you can improvise your own if you tell us how you did it :-)

In the past few years, more and more products are being sold to scanner hobbyists to assist in searching for signals like these.

You could use a portable frequency counter if you can get close enough, or a counter and a beam pointed at a cop :-)

You can leave one of those new Scout counters overnight
in a car parked near the police, powered by the car battery.

If the police use PL and you have a PL decoder on your
scanner, have it search day in and day out for traffic
on other likely frequencies for signals with a matching PL code
and use a tape recorder.

Other tips are found in the attached FAQ.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp., and available
from Grove Enterprises for about $25. This second edition
is crammed full of police, fire, local government, news
media, sports, national park, and commercial broadcast
frequencies for all 50 states. The information was
compiled mainly from members of the world's largest
scanning club, the Radio Communications Monitoring
Association (RCMA). Monitor America contains detailed
communications system profiles and precinct maps for major
metropolitan areas. Police and fire radio codes and unit
identifiers unique to local agencies are listed for several
cities. This differs from Police Call, which gives a more
sterile, but uniform treatment of licensees, listing even
the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 | instead. The fields are similar to PerCon's Spectrum CDROM | (see below), but the transmitter and licensee location are | intermixed which makes query results confusing. The first | release has problems with mistakes in the data and | documentation, and I look forward to a new release to | correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells | for $29 and contains a handful of fields for every FCC | license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in | several states, I will locate FCC licensed and selected FAA | transmitter sites in an area of your choice, and produce a | custom color map. I call this new innovation RadioMap(TM) | service. It allows you to identify antenna sites | (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood,

near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, | RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on

the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the

taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

JKXP> policeman, fireman, a goverment official, a news reporter, or
> a ham radio operator.

JKXP>Like I said this may not be the exaclt law but it came from a
>law student who was a scanner enthusiast.

I'm an attorney. The above is true. There is also another legal way to have a scanner on your person or in a motor vehicle, that is in the same statute referred to above. Written authority from a chief law enforcement official. Go to your local Sheriff or Chief of Police and request a "Letter Authorizing Police Scanner." If you local police have a policy against granting such authority, go somewhere else. The law does NOT state it must be the chief law enforcement offical where you reside. The current Marion County Sheriff (and probably the newly elected Sheriff that takes office in January) has a policy against granting such permission. I went to a little town and got the chief of police to issue me a letter.
Just remember the consent will expire if the Chief Law Enforcement Officer who signed it leaves office.
Getting a ham license is probably the most trouble free way to have a scanner in your car. Now that you can get one without morse code, they aren't hard to get.
DO NOT have a scanner in your car without some kind of authority. Even if all the frequencies programmed into it are NOT police frequencies. The statute says "a radio CAPABLE of receiving police radio transmissions.." Virtually every cop in a police car has a scanner, so they are all familiar with them. Possession of one illegally is a misdemeanor that goes on your permanent criminal history. If you've never been arrested, you don't have a criminal history. Don't start a criminal history document with a "police radio" arrest.

> If the police codes are standardized throughout the country, could someone
> please put a translation up.

Sorry they are not! Each law enforcement agency can set their own codes
either signal codes, 10-Codes or penal code numbers. Of the all the police
forces in my around Ottawa, Canada (Ottawa,Nepean and Gloucester City Police
Forces) The OPP (Ontario Provincial Police Force) The R.C.M.P, the Quebec
Provincial Police as well as the Cities of Aylmer, Hull, Gatineau, Quebec
just across the River from me, as well as the Military Police use their
own ten codes 10 Police Forces 10 different 10 Codes.. Egads!

yes, but you may want to just set aside channel 1 for this task.
then if you use a timer to turn on the scanner, it 'wakes up'
on the channel you want (lock out 2-39 for this special task).
i suppose you could do a mod so the radio comes on not scanning.

Why would a news reporter be allowed to have a scanner and a common citizen not be allowed to have one??? News reporters have absoulutely no connection to public safety. Can reporters help in a natural disaster, NO! And what would prevent me from saying I'm a freelance reporter?

6538. The AR8000's computer interface (LONG!)

Newsgroup: rec.radio.scanner
Date: 1994-12-09 04:02:52 UTC
From: Flying Turtle <vhealey@crl.com>
Message-ID: <3c8ktc$lha@nntp.crl.com>
Source record: 264494
Cross-posted to: rec.radio.scanner,alt.radio.scanner

First impressions of hooking the AR8000 up to the CU8232 remote control interface.

I finally got around to hooking the AR8000 up to my 486DX clone. This is much neater then I expected. Every moment opens up new discoveries. Right now as I write this it is scanning and every time the squelch opens I get a print out of the signal level and the received frequency as I listen to the local Cobb county trunking radio system. Data on the screen looks like this...
LC1E RF0857737500

LC20 RF0857987500

LC1A RF0856987500

LC23 RF0857737500

LC1E RF0859987500

LC22 RF0860212500

`LC' is the S meter command and the next two digits are the signal level in hex from 00 to 3F. RF is radio frequency and the rest of the digits are the received frequency when the squelch opened. Once executed the LC command repeats data output to the computer while scanning until another command is executed to the AR8000. Can you think of an application for this? Your term program could add the time each time data arrived for a logging function for instance. You could have the computer speak the data plus time to the soundblaster card and you could record that along with the audio on say a stereo tape for surveillance purposes.

I decided to use ProComm Plus for Windows version 2 to communicate with the scanner since it has a fairly powerful script language that interfaces well with windows. PC4W opens up a chat window which I have set as black text on white and a default blue window with white text for the output from the scanner. Both windows can be copied pasted etc. I type or paste commands to the chat window and watch the scanner reply in the term window. The connection is set at 9600 baud. I am not trying to run any script right now since I am testing each of the 40 or so commands to see what each does.

The MR command places the scanner in memory recall mode. You can point to a particular spot in memory. Here is the result when I point to bank c location 18. Mrc18

MXc18 MP0 RF0156150000 ST002500 MD1 AT0 TMSmyr PD

from left to right grouped by space just as the computer sent it...
MX memory store command if issued by me to channel c18

MP pass toggle also known as lockout 0 says it is off a 1 would turn it on if issued MP1

RF the radio frequency stored at this location which is 156.150 MHZ the resolution is down to 50HZ in this scanner.

ST the current step size stored in this channel 2.5 KHZ which is set incorrectly I see. I will
issue just the ST command with a 15 to make that a 15 KHZ step which I would want if I had to move this information into a vfo to tune away from it for related services in this area. ST15. follwed by a MR command gives this.
MXc18 MP0 RF0156150000 ST015000 MD1 AT0 TMSmyr PD
Notice the change that took effect. MR without any parameters will return the values at the last location accessed.

MD is the mode and in this case is NFM=1
0=WFM
1=NFM
2=AM
3=USB
4=LSB
5=CW

AT is the internal attenuator switch for strong signals and it is off for this frequency location. Remember 0= false off etc 1= on true set etc.

TM is the text identifying this memory data and it displays with the frequency when this channel is scanned. It can be up to seven characters and space long. In this case it is Smyrna Police Department =Smyr PD. Entering text from the controls on the scanner is rough but a snap with the computer interface. You can edit any location by merely pointing to it using MR and then updating the text by issuing TM ..text followed by a cr. If I enter more then seven characters after the TM command but before the cr. the scanner truncates it to the left 7 characters and spaces.

I notice that on the computer interface there is an led that lights when data is going to or
coming from the scanner. Nice for checking operation when things aren't working. It didn't work for me until I opened the chat window.

MA causes the scanner to dump the current scan bank. Here is its output for bank c.
MXc01 MP0 RF0856212500 ST002500 MD1 AT0 TMCOBB CO

MXc02 MP0 RF0856737500 ST002500 MD1 AT0 TMCOBB CO

MXc03 MP0 RF0856987500 ST002500 MD1 AT0 TMCOBB CO

MXc04 MP0 RF0857212500 ST002500 MD1 AT0 TMCOBB CO

MXc05 MP0 RF0857737500 ST002500 MD1 AT0 TMCOBB CO

I had a Pro-32. Great radio.

The Pro-32 only scans up to 512 mhz. So the radio doesn't reach the
cellular bands up at 800 mhz. No need for Tandy to include blocking,
so there's no diode to bypass the block. But there is hope.

I gave mine to my dad and included a GRE SuperConverter ($90 from the
usual suppliers, but going fast since their import and manufacture has
been prohibited). It converts the 800 mhz band down to 400 mhz,
within the reach of the Pro-32.

The radio scans in 12.5 mhz steps in this range, but it is still quite
workable for listening. Cell frequencies are spaced 30 mhz apart and
snipping the diode on cell-capable scanners (Pro-37, Pro-43,
Bearcats...) often scan with the correct increment (thanks guys!).

The converter takes its own 9v battery, but I ran wires from the radio up to the it (same voltage, fortunately) and it powered on when I turned on the radio. This way I only needed to plug one dingus in the wall for recharging.

6544. [Q] TV to monitor 500-7700 MHz?

Newsgroup: rec.radio.scanner
Date: 1994-12-09 07:02:13 UTC
From: browere@einstein
Message-ID: <3c8vdl$61s@nic-nac.CSU.net>
Source record: 264502

I have read, on more than one occasion, that televisions can be modified to pick up the 500 to 700 MHz range. Is this so, or a wive's tale?
If so, how does one do it? This range happens to be what I am interested in, but would the TV be demodulating WBFM, or the NBFW that I would like to monitor?

Any appropos info. would be greatly appreciated.
Thanks in advance,
Eric

Yes our scanners are only as good as the antennas that we have attached to them. I know this is pretty basic but this is why I am searching. I am presently listening to frequencies mostly in the 462 MHz, 413 Mhz and 155 MHz areas,and am looking for a great antenna. I am presently using a antenna cut for 462 Mhz approx. and not being a genious about antennas I am looking for advise on the best antenna to use.

This is for a handheld radio. Thanks.

>
>1. What is IF conversion,

Starting with a Radio Frequency (RF) signal, conversion of a signal
at one frequency to one at an Intermediate Frequency (IF), while
(usually :-)) retaining the information therein. After succesive
stages of conversion, the aim is to reach Audio Frequencies (AF)

>and what is the difference between double
>and triple conversion?

an extra stage of conversion. Without going into technicalities,
the main practical benefit of a triple conversion receiver is the
virtual disappearance of "images" of an unwanted frequency
overlaying what you are trying to scan

>
>2. Most of Radio Shack scanner don't carry the 200-400MHz band. Will I
>miss out on much if I get a scanner that doesn't include those
>frequencies?

UHF aircraft band - predominantly military aircraft up there, also
some space shuttle comms use this, also FLTSATCOM (Fleet Satellite
Communications). Military aircraft would be your main reason for
wanting it, IMHO

>
>3. Where are the Weather Service Bands located?

As I remember, somewhere 160-170MHz, but I'm sure someone local to
you can give you precise numbers

Happy hunting,
Julian.

No, not that I know of. Are they not using 154.415 anymore? The last that I knew, they were using this frequency. There are others they use for fireground, metro nets and such, but the above channel should be their primary.

To restore the 800 frequencies, perform the following steps (I've never tested this out - no guarantees):

Radio Shack PRO-2005 Scanner

1. Unplug the radio
2. Remove the screws and take off the top cover.
3. Look for D502 on the inside right hand-side of the front panel.
(No need to unsolder the silver plate protecting the vertical board!)
4. Simply cut the diode and reverse the process.

6562. Icom R-100 strange behaivor

Newsgroup: rec.radio.scanner
Date: 1994-12-09 21:39:13 UTC
From: ofarrell@bashful.rd.qms.com
Message-ID: <1994Dec9.213913.29504@qms.com>
Source record: 264521

My dad has had an Icom-R100 for about nine months now, and has enjoyed it tremendously. But, about a month ago, it starting doing something strange.

He uses the function that scans a frequency range (I can't remember what Icom calls it). What has started happening is that while scanning, it will stop on some signals, and on others it will not. When it encounters a signal that it doesn't stop on, you can see the s-meter shoot up and hear the signal for a split second, but scanning never stops.

When this happens, you can stop it manually, back up to where the signal was, and, sure enough, there is a signal there that you can receive with no problems.

He returned the unit to Icom (since it was still in warranty). The technician who work on it said he couldn't reproduce the problem, and wrote the following comments:

"Checked radio's scan operation. No problems found. Suspect symptoms due to "intermod" and possible front end overload from strong signals. (Also, check sql setting)"

Has anyone else seen something like this? Any suggestions on something he might try to make this go away?

6564. Re: [Q] TV to monitor 500-7700 MHz?

Newsgroup: rec.radio.scanner
Date: 1994-12-09 22:17:28 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <3cal1o$1us8@tiger1.ocs.lsu.edu>
Source record: 264524

Isn't that the UHF (ch.18-ch.52) band?
If so, your tv already does,or should pick it up. As for the audio,
I THINK it's WBFM, but it will pick up cellular in the 800mhz range
if your tv is a dial tuned tv and goes up to ch 85 (no longer used
channels 65-85 (?))

Eric B. (browere@einstein) wrote:
: I have read, on more than one occasion, that televisions can be modified to

I have a BC250 that died. I've traced the problem
to a special IC that the service manual shows to be
a multifunction part (dual modulus divide by 10/11)
and pre-scalar that only Bearcat made.
Of course, this part has been out of support life
for at least 10 years.

My question: is there any repair shop out there
that might stock the obsolete stuff?

The test sequence works with many Uniden-made Bearcat scanners, but
not with the earlier scanners made by Electra.

The 210XL was made around 1981 by Electra's plant in Puerto Rico.
The 210XLT was made about 5 years later in Taiwan after Uniden
bought out the Bearcat scanner line.

>> PS> small point: It's Continuous Tone Coded Subaudible Squelch.

>>Would there be anyway to maybe get this to work so I could listen to
>>certain departments in a trunked radio atmosphere?

You won't find CTCSS on trunked systems (except on the inputs in some rare instances to solve co-channel problems). Everything is controlled by computer; there is no need for CTCSS or DCS or any tone signalling.

For Sale:

Radio Shack Pro-2022 Scanner

- 200 Channels in 10 banks
- 30-54, 108-174, 380-512, 806-960 MHz Coverage
- Full 800MHz !
- Desktop Model
- 10 Monitor Channels
- Direct frequency search
- Limit frequency search
- 2 second scan delay, selectable for each channel
- channel scan lockout
- priority channel
- DC adaptor for car use
- box, manual
- very clean

I will ship this scanner to anywhere in Canada via C.O.D. Asking $300.
May throw in a cellular magnetic-mount antenna, 3db gain, works extremely
well (even outside cell band), worth $50.

Contact via E-Mail or 613-860-0254

George

6579. AR8000 volume/programing was Re: AR8000 (Search funtion)

Maybe I am going deaf in my old age but I don't like the audio
that much as it rattles the case. While eating lunch I had it
sitting on a table in my favorite mexican resturant. A guy FIVE
TABLES AWAY came over and excused himself and asked me about something
he hear on the scanner. He was listening to it! I gues it must have audio.

Possibly you may want to get together sometime to
1. Have a dump of all the frequencies I have programed into mine.
2. See if we can clone yours to celluar. No one has tried it yet
that I know of. I don't think it can be done but Jonathan thinks
it can be.

No need to hurry as I am still programing this thing. I am
trying to figure out the best way of just squirting the data out
of a database into it with little effort on my part. The problem is
I am using a 1991 database and I know some of this stuff is wrong.

You have 20 banks to prgram and some thought must be given to
a logical way to do so also. Scan speed is increased if you also
order the frequencies in the given bank to minimise the shifts
needed by the vco (a minor tech point but if you have a hot rod
you want to max it if possible). This later can be adjusted after
they are fully programed by sucking all the data back out of each bank
and having the IBM PC sort it and then blast it back to the
scanner. Having the text with the frequency is heaven. I used to
have to have a given channel in a given bank to help jog
my memory as to what I was listening to. I compared listening to
the Pro43 and the AR8000 side by side and I noticed I knew faster
what it was with the ar8000 things that i knew and recognized
by heart on the Pro43. A werid feeling at first.

For now I decided to use the bank letters as added nemonics.
In the lower case banks a thru j i did this
a = Atlanta City Hartsfield
b = Gwinnet County Hall County and points fruther east metro.
c = Cobb County and Military AFB
d = Dekalb County
e
f = Fulton County College Park Hapeville Forest Park
g = Georgia State
h
i
j

I haven't really put anything in the top 10 banks A thru J
I feel J should stand for JUNK since that is used by the search
function for auto store if set by the switch.

I propose using one bank to store 25 coded band limits in the format
start freq. text explaing what it is step size mode
and in the nest place up the end frequency adn possibly other data.

Ie TV/Radio i00 F450.000 ST01250 TMTVradio

The BC2500XLT is triple conversion, but it's so poorly designed that you'd think it was a double conversion receiver. <g> The BC3000XLT, due at the very end of this month, will at least have an attenuator button to cut down on intermod. Still, this ain't in the performance class of a GRE.

Thanks for the information - where did you come up with a cable? Did you buy it or fabricate it?

If you bought the AOR kit, do you get a new battery cover, or do you just leave it off when the cable is connected? Would you describe the software?

If you made the cable - please share the info - source for the connector and pinout.

Thanks.

Hi Brian,
News reporters DO have special privileges--just try to get into a presidential press conference (or even a college football stadium press box) without the proper credentials.
I'd contact a local smaller radio station and offer my services absolutely free as a spot news reporter. Get the news director to type a letter on the station's letterhead affirming the fact that you are a stringer, and carry the letter in your glove compartment. Phone in a news tip once in a while, and who knows--they may even start paying you on a per-story basis. Good luck! ---Dan

Message-ID: <1f1.2563.3415@the-boss.com>
Source record: 264250

TO : snak@netcom.com
Uniden BC200/205 Business Band Restoration

Prior to performing this modification take the following precautions to insure that damage does not occur to any component inside of your Uniden scanner.

A) Try to perform the modification in a low static electricity environment.

B) Avoid wearing wool clothing or walking across a carpet (in low humidity areas) as well as touching your scanner or any component inside the chassis.

Required tools: A small phillips screwdriver and a fine-pointed snipping tool.

MODIFICATION PROCEDURE ----------

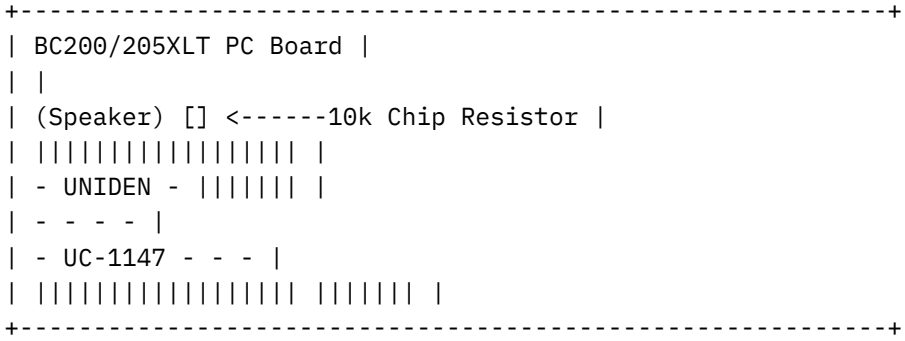
1) Disconnect the antenna and slide off the battery pack from the scanner.

2) Remove the two screws from the back of the scanner plus the two screws that hold the battery pack retaining spring in place as well as the spring itself.

3) Carefully pry the bottom of the rear of the cover from the radio then remove the cover.

4) Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the BASE (the two halves are connected by a plug so their will be some resistance) and separate them.

5) Consult the illustration below and locate the IC labeled "UNIDEN UC-1147" and the 10K chip resistor positioned above the letters "DEN" on the integrated circuit. (The resistor will be color coded brown-black-orange).



6) Using the small wire cutters, cut the resistor in half. (Be careful as the resistor may shatter causing debris to scatter along the PC board). Be

sure to remove all left over residue by blowing or brushing it away. The solder pad that the resistor was soldered to may peel up as you remove the resistor. You may peel the pad off if done carefully not to disturb the surrounding area or components.

7) To reassemble insert the top of the front panel into the slot under the volume/squelch control panel while noticing the alignment of the dual in-line connector at the bottom of the board with the mating socket and finally pressing it (the front panel) in place. Be sure that the holes in the PC board line up with the holes in the plastic standoffs under the board.

8) Insert the two screws and gently tighten. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel. Press the cover into place, insert and tighten the screws. Replace the battery retaining sprint with the slotted side facing the notched hole. Insert the two remaining screws and gently tighten them. Slide the battery pack into place and switch the scanner on to make sure the display comes on. If not, check that the battery is charged and/or the battery retainer spring is properly mounted or dual in-line connector was misaligned during reassembly. Assuming the modification and the reassembly was successful, switch the scanner on, press manual, 845.0, E and within a couple of seconds you should see the frequency 845.000 MHz displayed. The modification is now complete!

Try it it is very easy to do.....

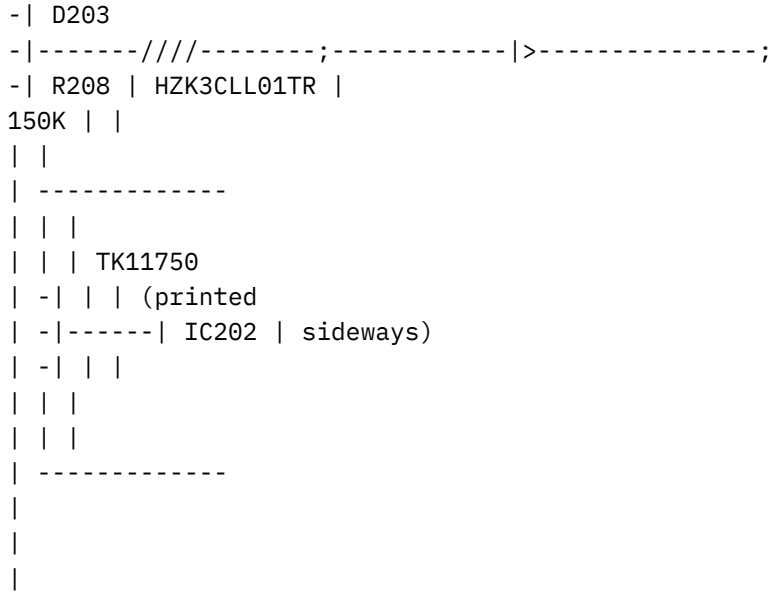
BC200XLT SHORT BATTERY LIFE SOLVED
BC200XLT

It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor provides the answer.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.



SHORT CUT
****THIS IS THE ONE TO USE****

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The radio now operates uninterrupted until it blanks out when the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge
the original diode with a 6.8K resistor, defeating the
premature recharge signal, yet preventing the battery from
too low a discharge.

Recently (the last month or so), the Williamson County Sheriff's Office (154.86 and 154.725 + other) communications has referenced "channel 8".

My question: What frequencies are involved (I do know it is in the 800+ arena)?
Is this part of a trunking system or is it discrete?
I assume it may be scrambled?

Please share what you my know here on rec.radio.scanner.

Thanks.....gary

There's always the possiblility that certain departments use diferrent
CTCSS tones to access the repeaters and for the repeaters to access them.
But in most cases, the tone is the same for the whole system (all
channels, all agencies).

Hi All,
Damark currently has the Bearcat 2500XLT scanner available
both refurbished ($400) and new ($450). Since I'm not familiar with
it, any advice is appreciated.
Is it a worthwhile unit? What frequency ranges (as exactly
as possible) does it handle? The ad isn't very clear. Is the
handheld range decent? Is battery life ok? Spare batteries
available? Does it receive all 800/900 MHz freqs, or can it be
fixed?
I'd appreciate any input; thanks a lot!
Regards,
Jim

P.S. They're also advertising the Bearcat BCT 2 state-by-state
highway patrol scanner. Anyone familiar with this box?

Yes, they're pretty good, if you like dealing with Rat Shack <G>

Seriously, though. The PRO-46 is a good scanner. It's restorable, with
800 MHz public saftey, and civilain air craft band. No Military air.
It's a 100 channels. You ought to be able to pick one up for about
$180.00 on sale.

What do you mean exactly, codes? Jargon is usually the same, radio
codes like 10-21 differ from county to county, state to state. I know
both, so if you clarify, I can give you the Jargon, and our radio codes.
Is there any jargon that you specifically would like?

To: ANYBODY!!

I'm looking for a scanner antenna. It's an antenna that goes entirely inside an attic. I've heard from a couple of people that it does exist, so ther really is such a thing. Okay--> Here it is. This thing is supposed to be custom built to fit inside your attic. It's also supposed to line the ridges of your roof so that it turns you entire roof into a huge receiver. If anyone has any type of information, or has heard of anything like this, please let me know. I'd love to be able to get in touch with a company or person or store that makes this.

Thanks a
lot,

Adam Ohren

6603. Re: The AR8000's computer interface (LONG!)

Newsgroup: rec.radio.scanner
Date: 1994-12-10 21:49:47 UTC
From: Flying Turtle <vhealey@crl.com>
Message-ID: <3cd7pr$ap0@nntp.crl.com>
Source record: 264264
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Jim I bought the interface from Johnathan over in England. When I get the time I
am going to post observations about buying from overseas but I would do it again
in a heartbeat if they are all as nice and reliable as Johnathan is.
When I vocied a few misgivings about the AR800 after receiving it he immedatley said
he would take it back for a refund if I was not completely happy.

I can't get half the people from Radio Shack to do that without a fight.
Anyway I wouldn't part with this radio for anything a present I really love it.
The interface which cost about $130 makes the pleasure of owning thins a
lot better. I would hate to program all 1000 channels and 20 search banks
by hand!!!!!!! It would take a month or more. Plus if you aren't
careful you can inavertantly delete a channel when using the delete function
in the scan mode. Pop, that sucker is gone never to be recovered and has to be
reprogramed. Imagine the suprise of someone who deletes an entire bank in the blink
of an eye by not paying attention as to what they are doing.I delete the contents of bank
J all the time but there is always the chance of error and I could get j instead of J.
The computer interface makes resorting that data painless when it is set up
correctly.

Basically it comes with a flat wire with four leads in it that plugs
into the back of the scanner. It is reinforced with a flat piece
of metal the thickness of coke can aluminum to make insertaion and removal
a more secure process. Check an see if this receptical is in your scanner, it has
occured to me that a perfect way to render the scanner acceptable to the
fcc would be to epoxy that slot shut so it could never be used.
It is directly below the batteries. This cable goes to a interface box
which I suspect is a glorified null modem adapter. It has a standard 232 port
for your PC and another slot for a second AR8000 to be attachted for cloning.
It may have some buffering electronics, I haven't felt the need to open it
yet and have a look. If the pin out isn't in the ar8000 manual let me knwo
and I will post what it is here. I seem to remember reading about it in the
interface manual. Tonight or tommorow I am going to post a brief description
of all the commands they document the AR8000 will accept for those that
are curious. I don't see any comands like peek or poke that would allow
you to examine the internal programing of the AR8000. Johnathan said there
are some folks on Compuserve that have done a dump of the AR8000 rom and located
the bandplan.

As soon as I can find someone local that has a USA version who is able
an willing to get together with me I will try to clone the European
version to his. I could do this anywhere I travcel in my work from Dublin,
Warner Robbins GA to North Al around Huntsville. It should take about 5 to 10 minutes
and we could do it in a coffee shop. The interface is extremely portable and
draws its power from the AR8000. If they aren't happy they can always clone it back

with another USA version as the source. This is all assuming they haven't killed the 232 interface somehow in the US version. If they have I would send it back and quitely order on e from Johnathan before customs wises up and blocks them.

:>)

You just leave the cover off while using the interface, no big deal.
I just looked at the manual and the pin out is the pc pin out
from the interface discussed. They don't clue you as to the
nature of the flat ribbion cable.

Reread page 103 of the AR8000 operating manual and tell me what you
think each of the three clone/copy options will do.I may try and see
if I can get the AR8000 just to dump data to the IBM PC as if it were
another AR8000. Has anyone tried this yet?

6607. Ramsey SCN-1 (400Mhz --> 800Mhz)

Newsgroup: rec.radio.scanner
Date: 1994-12-10 23:27:38 UTC
From: cap2624@ultb.isc.rit.edu
Message-ID: <1994Dec10.232738.17503@ultb.isc.rit.edu>
Source record: 264428

I was considering getting the Ramsey SCN-1 Scanner converter rather then trying to find a Cell Modable scanner and have it be one that I like simultaneously. With the SCN-1 I can get any old scanner I want, the one with the features etc, and still get Cell freqs. The SCN-1 Converts the 400-550Mhz range to 800-950Mhz range. My questions are as follows:

Does anyone have any experience with the unit?

Since most scanners dont use a VFO, and are channelized in xKhz steps, will this converter LINE-UP the frequencies exactaly? Or will 800.00 Mhz appear in, say, 402.50 Mhz instead. This could cause problems, since the the average scanner will never be able to "step" onto the correct frequency.

How linear is the realationship between the 400-550 Mhz and the 800-950 Mhz bands after conversion?

Comments/suggestions welcome!!!

: attention reporters are much smarter that commoners and really
: should be running the government at all levels along with most
: aspects of your personal life. Leaving Indiana seems a reasoable
: step.

A far less onorous way than leaving the state would be to look into getting your "no-code" amateur radio license. For over two years now the "technician" class amateur radio license which grants operating privaledges for all amateur bands over 50.0MHz has been attainable without needing to know morse code.

To look into getting a license (the regulations, operating rules, safety rules and some electrical/electronic theory are tested by way of a multiple choice test) buy a copy of "Now You're Talking" from the ARRL (1-800-32NEW-HAM) or it can also be found at almost any Radio Shack. Cost is $19. The book contains all the study information you need to pass the test.

Just as the Indiana law exempts hams, every other similar law (about 5 or 6 other states prohibit scanners in autos) in those other states also exempts hams.

Of course once you get a ham license and can operate on the 144MHz band and other bands with their many repeaters you may never go back to just being a scanner listener:-)

Look into it, the test isn't hard at all given a few evenings of study. If you've got any electrical/electronic knowledge at all you'll find you need only study the rules and regulations.

I am interested in getting an IC-R1. I was wondering if it is a good scanner. Is there any other scanners out there that covers the same range (100kHz - 1.3MHz, I believe) in a small,compact physical package that lacks the celluar lockout? I have a really old Uniden but it is just a huge clunker to carry around. Also, is there a performance difference between a locked-out R1 with a convertor and a unlocked R1?

Thanks
km

You look in the paper at the dollar/pound exchange currently
around 1.5600 Multiply this by the pound figure to get your total
charge on your charge card. I had to pay an additional six percent
import tarrif in cash on UPS delievery. The radio delievered was
$616.20 plus $36.97 a US import tax levy. That makes it competitive
with local sales but gives you certain advantages. It comes second day
express.

>
>As we know say to people enquiring about these sets and others the

Aside to Vic: Could you reconfigure your editor for a shorter line length?
Your postings are hell to read, and even harder to quote as the lines
spill over all the time.

I've bought occasional small things from overseas before, but nothing like
a $600 scanner until I ran into Jonathan. As dealers go, Javiation is
exceptional - though it is a very small operation that can get a little
backlogged when demand exceeds manpower.

Javiation is an airplane parts dealer, and has been branching out with
other product lines of interest to aircraft enthusiasts. This includes
scanners ... and 2 years ago when the Yupiteru MVT-7100 was about to be
released, Jonathan wandered from the Aviation SIG on CompuServe into
Hamnet. He posted little teasers about the upcoming new model, always
taking a low profile and avoiding blatant commercialism in a very
admirable manner.

Amongst the scanner fanatics there, we had several flurries of email as to
who would be the guinea pig ... I acted first, and the grand experiment
began. In the paranoia over recent laws affecting radio equipment, we
didn't know what to expect. I probably had the first MVT-7100 in North
America (not counting Jonathan's visit to Miami with a production sample
earlier that winter). Once he got the necessary paperwork down to a
science, shipping scanners to the US became a routine thing.

This spring Jonathan made one of his periodic visits to the US. He took
time from sightseeing (and pursuing the aviation hobby) to meet a bunch of
us in New York. We've all forged lasting long-distance friendships, and it
gives me special pleasure to put in a plug for Javiation from time to
time. I'm pleased to see the latest crop of happy customers posting about
their new toys.

Jeff Goldman told me to put aside the manual and just use common sense
with the menu prompts. It works for basic functions, once you learn what
the terms mean.

>The supplied rubber duckie is REALLY BAD. I have a collection of
>antennas from other radios, cellular phones, and homebrewed whips.
>EVERY ONE OF THEM was better than the original. I couldn't find any
>frequency that the original duckie was better on.

Worse, the duckie overhands the BNC connector on bottom, so it scratches
the case. I dumped it in an instant. My standard all-around scanner duck
is the GRE all-band (sold by Radio Shack with the old PRO-34).

>In spite of the complexity, I punched in around 50 channels without much

Ditto. Once you get the hang of it (and the steps are very logical and
streamlined) it's automatic to do.

>Memory is EEPROM - no worry about losing memory if batteries go dead, no
>backup lithium battery needed.

Yeah. The Yupi will forget after a few weeks of no power.

>Sensitivity is very good. While waiting for the radio to show up, I
>rewired my antennas to route them through an A-B-C switch. I can't tell
>any difference in reception between my long wire and my Diamond discone

We've compared it with the MVT-7100. There are bands where one radio wins
over the other, and vice versa. Overall the Yupiteru is still the overall
champ for sensitivity by a hair. But the AR8000 is overall less prone to
intermod, which makes it more useable on many frequency ranges.

: Again I agree!

: Vic Ki4je

I agree with lots of popping when tuning SSB and CW. Seems to happen most in the 75 meter phone band. Not so much on 20 meters. Tuning knob is rubbery so it tends to wobble a little on the shaft. I pulled mine off and that's when you can see it is made of rubber or something like it.

SSB reception is not as good as my Yupiteru 7100 which is almost the equivalent of my HF rig. SSB signals on the AR8000 seem to me to almost

sound like the audio is a little distorted. Can't really tune out the "Donald Duck" sound as well as on the Yupi.

Overall I like the Yupi much better for it's performance, sensitivity and audio clarity. I like the AR8000 for it's features, especially the alpha tags. Radio is real nice on VHF and UHf.

: Andrei Petrov petrova@yvax.byu.edu

I had a Sony Pro 80 and sold it when I got my Yupiteru 7100. The Pro 80
was somewhat more sensitive than the Yupi. I also have an AR8000 and am
not crazy about its performance on SSB ham radio signals. The radio is
also no where near as sensitive as the Yupi and can't touch the PRO 80.
It also seems to me that the AR8000 has a higher noise floor than the Yupi.

Source record: 264444

I don't see a problem with scanning while in the departure lounge,
but if your scanner generates radio noise while you are aloft,
you could affect the avionics and end up splattered across a corn
field somewhere. And that would be bad.

Rather than conceal your scanner, why not contact the airline and/or
the flight crew and see if it's OK. I'm sure the other 100+ souls
on your aircraft would appreciate this responsible conduct.
After all, it's in your own best interests to keep the airframe
out of the ground.

By the way, if you're in a country where it's legal (like Canada),
you might try scanning the cellular band while you're at the
airport. It tends to have more interesting content than plain
old suburbia.

I was told that my Uniden SC150 will receive images of cellular in the upper 800mhz range even though the actual freqs are locked out. What causes this imaging? This is true because I have picked cell transmissions up before when scanning through that band. Also, what is the correspondence (if any) between an image I run across and the actual frequency?

I also was told the GRE Scanner Converter from Grove would suffice for a mod to unlock cellular. What exactly is this, and, more importantly, what does it do?

And finally, I was train-chasing the other day with my scanner and could hear the dispatch and crew of a small CSX yard on 161.100 I believe. Unfortunately, that only carried dispatch-road and the yard crews, but not road-dispatch. Any ideas for that frequency?

Thanks - Keith W.

device??

I have the PRO-39 and it has partialcordless phone capability.
Its freq range for 800Mhz is as follows:
806-823.9375, 851-868.9375, 896-
960Mhz.

As you can see, there are bi chunks missing in the 800Mhz band. But, I
can still receive cordless phone conversations between 851-868.9375.
Also, there are a few cordless bands in the 900's, and scattered in the
800's.

6645. Examing AR8000 Memory (First try)

Newsgroup: rec.radio.scanner
Date: 1994-12-11 15:24:38 UTC
From: vic@ping.com
Message-ID: <vic.162.2EEB19B6@ping.com>
Source record: 264454
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have figured out how to make the AR8000 dump its memory to the IBM PC.
You select function zero in expert mode. If you ask for just a data copy and
press enter on the AR8000 it just sits there.
Send it a cr from the IBM and it sends %000# and sits there.
Send it %000# and it will send a packet of data 128 characters long ending in
another %xxx#. Here is an actual dump of a little of it...

%0000#2020202020205301000005000091550173 6F683144454D0100002500000006304736F
683244454D0100002500500263047 36F683344454D0100002500000563 04%0040#736F683444454D
0100002500500763047 36F683544454D0100002500001063047 36F683644454D0100002500501263
04736F683744454D0100002500001563 04%0080#736F683844454D0100002500501763047261703 1
44454D0100002500000068047261703244454D0100002500500268047261703344454D0100002500
00056804%00C0#

If you ask for a system data dump it starts with memory location 6000(hex).
You get mostly FF's until you reach 7000(hex) where there is I guess 256 to
512 bytes of data. I didn't go any farther since I was manually responding to
the AR8000. If you try to make it go backwards it will not except to resend
the data you did not acknowledge. The # seems to be very important sending
it by itself causes the AR8000 to send a memory address followed by a #.
It must mean tell me where you are. When you ack with the %xxx% I guess it
feels you are with it and it is ready to send more data. On certain memory
boundries it sends a sequence of repeated %xxxx#%xxxx# were xxxx is a hex
number.

If this helps someone get started examining the memory have at it.
Any ideas as to the use for this?

For the ultimate frequency tracking program I suggest you try the FCC Frequency Retrieval System Ver 2.xx from ScanWare Associates. It is cheap enough...just $40 for the program and the entire FCC database for your state. Its fully editable and will also allow you to add and delete listings. If you have a computer controlled scanner, the FCC FRS program can generate ASCII or SDF files to program your scanner. This little known program is sometimes advertised in Pop Comm. I saw it at a hamfest someplace and snapped up a copy quick. ScanWare also has a BBS with a lot of free files on it too....(206) 871-4591/4228

Possibly the design reason for the weird antenna is that by bringing the outer sheath down to the level of the bottom of the bnc and therefore in touch with the scanner was to renforce a weak spot of radio design. The BNC can work lose do to mechanical flexing etc. This antenna would put more of that flexing in contact with the case relieving some of the stress on the bnc mount.

I personaly choose a slimer ham ht antenna with a fair amount of flex in it so a stiff antenna would not put so much stress on this area. This is my opinion and may not represent complete thinking on the subject. If I am right why didn't AOR engineers choose this as a means of protecting the BNC? These guys are by no means stupid! No one else has been able to design a radio like this.

I understand that a few years ago the Pentagon bought all of the existing AOR production and modified it for use in aircraft sent to the Gulf War. Anyone else hear that rumor?

Although you can build a solid state, compact equivalent,
I use a controller I built from a pile of relays and described it
about 7 years back:

FROM JUNK TO A JEWEL

Copyright 1987, Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author.]

One Saturday morning last year, my wife Pam, N9HRZ, brought
home 3 large gray steel relay boxes from a garage sale. She
didn't know what they were, but was sure they were a "steal"
at $5 apiece.

My examination brought disappointment. These 35 lb. "boat
anchors" appeared to be something ripped out of a factory
control system. The outsides were filthy, and someone had
spilled oil inside of them.

Pam sensed my unhappiness with her find, so she offered to
ask her dad, KA9CAI, to sell these boat anchors at a hamfest
so we could get back some of the $15.

For the past year, one box sat in my garage, and the other
two boxes sat in my father-in-law's garage.

Junk Reexamined

Each box had a large hinged door, protected against the
weather by a gasket. On the inside was a thick steel panel
with about 8 DPDT relays, a time delay relay, and several
toggle switches.

All relays were made by Potter & Brumfield, a top relay
manufacturer. Each had a 117 VAC coil, 10 amp contacts, and

was in a high quality Amphenol socket. The DPDT relays were enclosed in clear plastic dust covers, and had neon bulbs and resistors wired across their coils, which provided a visual indication of relay activation.

Components were wired together neatly to 2 large bakelite barrier (terminal) strips. All interconnecting wires had terminals crimped on at the ends, so a screwdriver was the only tool necessary to service the unit.

Now for the challenge: Could this "junk" be converted into a remote receiver controller, functioning like the one we brewed up at the Indian Hill ARC?

Time Delay Relay

The plug in time delay relay was a DPDT configuration, enclosed in a yellow cover. Instructions printed on the side revealed that the delay time was between 0.1 and 10 seconds, and was determined by the value of an external resistor.

Older delay relays use a thermal switch, which heats up over time, making or breaking contact after reaching a given temperature. Fortunately, my delay relay employed more modern circuitry. Inside was a printed circuit board with an actual solid state timer. The current Newark catalog lists this relay at $45, socket extra.

I wanted a delay adjustable between a few seconds and an 60 minutes. Not having a schematic of the timer, I applied 117 VAC to the coil and probed the circuit with a voltmeter. I found the capacitor that, along with the external resistor, determined the delay time.

A much larger capacitor was needed for long delays, but wouldn't fit within the relay case. I removed the original timing capacitor, and ran 2 wires from its old location to an external 220 ufd capacitor through a hole drilled in the case.

A Controller Takes Shape

The relays were rewired. A rheostat to set the timeout delay was mounted. Pilot lights, 1/4" phone jacks, and modular telephone jacks were installed.

The remote receiver controller at IHARC requires use of an external phone patch. We currently use a deluxe patch made by Waters.

Not wanting to tie up a phone patch for my home controller, I brewed up an interface to feed the audio output of a receiver to the phone line. It used a capacitor and 600 ohm

transformer salvaged from a discarded PC board, and a
varistor cut out from a telephone handset. The varistor
clips residual voltage spikes that could appear on the
telephone line from ringing voltage and damage the receiver.

The 35 lb. receiver controller works well. The only problem
to date is that the timer is unstable. Sometimes it times
out after 10 minutes, sometimes after 20 minutes, sometimes
....

I can use the setup to listen to a home scanner while I'm
away from home. As a "frill", I added a Morse Code
identifier. I recorded the message "Oswego RX" in CW on an
endless loop cassette tape, and play the tape on an old
cassette player. The player is powered from an AC outlet
which becomes live when the controller answers a phone call.

Hi, is there anyone know the frequencies of Yaesu PPL-2010?
If you know, please tell me. Thanks!

William

6655. AR8000 Memory Info (Long)

Newsgroup: rec.radio.scanner
Date: 1994-12-11 17:49:59 UTC
From: billy@panix.com
Message-ID: <billy-1112941249590001@billy.dialup.access.net>
Source record: 264463

Let me save you some trouble...

Here is the info on how the AR8000 stores the bandplan data used by the AUTO funtions. There is a "table" in the AR8000 EEPROM used to store the bandplan. This table has room for 128 entries. Each entry stores a 10 digit frequency, a 6 digit step size, a 1 digit mode, and a 1 digit flag byte. There is also a 2 byte entry that I don't know what it does, and a 12 digit field that is all F's.

The first entry defines the parameters that will be used until the frequency of the next entry is reached. When that frequency is reached, the other paramters in that entry are used (and are used until the frequency of the next entry is reached).

The data is sent and received as was mentioned in a previous message, via the clone function in the AR8000, and the use of a simple language. Refer to <vic.162.2EEB19B6@ping.com> for more info. One can use simple scripts and a terminal program (from any platform; I run a Mac) to mess with anything in the System area of the AR8000 EEPROM, but one can also totally mess up an AR8000 by sending it bad data. A full clone from another receiver may be the only way to fix an AR8000 that has corrupted data in the system sections of its EEPROM. I can't help you if you mess up. There is a lot more stored in the system area of the EEPROM besides the band plan table...

The data itself is sent with the info in each record backwards. A double ASCII encoded scheme is used, which is pretty inefficient, but what the hell, that's what they use. The table (from my AR8000) I am including at the end of this message has the raw data (as received from the AR8000) on the left, and the decoded information it represents on the right side. Please forgive me if the table gets word wrapped; I've tried to tell NewsWatcher not to wrap it.

The AR8000 I have is a UK version, so the band plan is the UK band plan, and there are no locked out frequencies or bands in this AR8000 at all. I would be very interested in seeing the bandplan data for the US model... This is the section of my AR8000's (system) EEPROM from location $7800 to $7FFF, which holds the bandplan data. This table has room for 128 entries, of which only 101 are used in the UK version.

Feel free to speculate on what the FFFFFFFFFFFF entry is used for in each record. Maybe for lockout of certain frequencies? I also have not figured out what the field between the step and the mode is used for.

What I really want is to reprogram my AR8000 to use a US band plan. I know how to do it, I just don't know where to get my hands on a detailed frequency plan for the US. (I'll never find the time to send to Washington for a printed copy of some FCC book). There are some obvious (ie easy for me) areas, like the 10K steps for the AM broadcast band, and the US FM band, and some of the VHF and

UHF band sections which I happen to know, but I would like to just do the whole table right, and send it to my AR8000. I have read a few messages on the HamNet Forum on CompuServe that the bandplan in the US units (just) shipping now is not right...

Enjoy.

Bill S

I have a Pro 2021 that I would like to mod for both cellular bands and Canadian Air Force freqs. I live near CFB Shearwater and would like to be able to monitor the SAR stuff. Email to AC523@cfn.cs.dal.ca.

Thanks,

Doug Spurrell

6657. ACE AOR 1500

Newsgroup: rec.radio.scanner
Date: 1994-12-11 18:11:05 UTC
From: stanlui@netcom.com

Scanner 10 months old in Good condition, hand held is similar to the AR 1000 but with sideband receive capability.Asking $375 .

6658. Panasonic KX-T4065

Newsgroup: rec.radio.scanner
Date: 1994-12-11 18:28:54 UTC
From: tag@public.compusult.nf.ca
Message-ID: <tag.2.00127BDD@public.compusult.nf.ca>
Source record: 264349
Cross-posted to: rec.radio.scanner,misc.consumers

I'm looking at purchasing a Panasonic KX-T4065 cordless phone. Do any netters have any experience with the Panasonic cordless phones? They claim to have a good S/N ratio but I would like to know how it works in real life.

I was also wondering if anybody knew how well the Secure Guard scrambling feature worked. How foolproof is it?

You can reply either by email or news posting - I'll be looking for any responses.

Thanks in advance !

Sorry about that. U of G is University of Guelph, pretty much everyone in Ontario has heard of it so since Ontario (Canada) listeners were probably the ones that would help me with this I didn't bother to be more clear. You are right though, I should have been more clear in order to increase my chances of getting help. Would you be able to help me now, or do you only have information for American cities? Once again Bob I am sorry about that.

Dave

>a review on it in Monitoring Times (Oct '94) which says that its
>performance is equal to that of the 2006, plus it has the advantage
>of 1000 channels, a VFO, and a "search and store feature."
>If the cellular phones are not important to you, you should seriously
>consider the 2035. However, if you want to monitor the cellular bands, try
>to find a used 2006.

I have a new Pro-2035 on the way. Can't wait to try it out. I do have
several Pro-2006 and Pro-2004 scanners. It will be interensting to see
if the 2035 is any better. As for opening up all the bands, I did hear that
there was a European model that does have the cellular band enables. Rember
the new law states "easily modified" the term "easy" will be intersting to
see if someone attempts to redefine the word. In any case, is there are models
out there that can received the callular band then I am sure the 2035 can be
modified.

6661. Locating repeater input frequencies..

Newsgroup: rec.radio.scanner
Date: 1994-12-11 19:48:45 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <17089D04DS86.WALLY@ukcc.uky.edu>
Source record: 264467
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have become interested in finding the local Police's input frequencies so I can either identify units very close to my proximity, or to see if they really do sometimes turn off the repeater activating PL tones and talk Simplex on the repeater inputs..

I am assuming that books such as Police Call only list repeater output frequencies? I have tried searching from 154.1 to 154.8 for known repeaters in the 154.815-.875 area..

Of course I'm also managing to pick up other rather strong signals that I can't identify.. *sigh* :) They don't have the same 'sound' as other stations I listen to regularly..

Any help is appreciated..

6662. Please help me with PRO2006

Newsgroup: rec.radio.scanner
Date: 1994-12-11 20:06:05 UTC
From: Pookie <76666.1001@CompuServe.COM>
Message-ID: <3cfm3ddih1@mhadg.production.compuserve.com>
Source record: 264468

I just got a pro2006 with no manual. Out of trial-and-error I have discovered that it must have 10 search banks where you can store an upper & lower freq in each one, but I'm not sure how to go about doing this. Also- it kind of looks like you can assign the 'priority' channel to any of the 400 channels- again, I don't know how to do this. Lastly- can someone tell me what the monitor, direct, and reset buttons are for?

Thank-you for your assistance.

>I have a Pro 2021 that I would like to mod for both cellular bands and
>Canadian Air Force freqs. I live near CFB Shearwater and would like to be
>able to monitor the SAR stuff. Email to AC523@cfn.cs.dal.ca.

While the PRO-2021 can be modified to scan the cellular band, the scanner
doesn't have the necessary electronics to receive in that range.

Cross-posted to: rec.radio.scanner,rec.radio.shortwave

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------- ----------

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*

7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset

frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

>"connect" me to my scanner?

Yes. Many phone answering machines have a feature where you can call
home and press a key on a touch tone phone, activating a room monitor
function. Place your scanner near the microphone used for recording your
outgoing message. My PhoneMate as well as many others include this feature.

Thanks for giving me new ideas for this.

6675. Fast Food Frequencies - Brief List

Newsgroup: rec.radio.scanner
Date: 1994-12-11 22:26:08 UTC
From: g9153402@huey.csun.edu
Message-ID: <3cfua0$sbi@nic-nac.CSU.net>
Source record: 264329
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

Since there has been quite a few posts wanting this data, here is a
list of fast food frequencies that is listed in the November issue of
Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies
to every fast food chain for their own use, and that any fast food
restaurant can buy whatever low powered FM transmitters / receivers
they need for their store at an electronics shop. Anyway, just stick
the below in one of your scanner's channel banks, and see what comes
up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

This isn't any fancy mod or anything, but if you get one of those
answering machines (certain AT&T models) that allow you to listen in on
your home, you could set the scanner by the answering machine. The
listen-in feature was on some relatively inexpensive answering machines a
few years ago.

My AR-8000 comments and opinions - not trying to start flame wars :)

- The audio is much better that the AR-1000 XLT.

- I find the VHF sensitivity is better than my AR-1000 even with the supplied antenna (which some have referred to as a dummy load). I normally carry my 8000 in my side pocket.

- I think the supplied antenna is broadband thus, any tuned antenna will do better at its resonant frequency than a broadband antenna.

- WARNING - don't use earphones if (in expert mode) you set squelch level on. This disables the squelch control and there is no safe way to set the volume control. I blasted my ears a couple of times before I realized what was happening. With the squelch level set to off, the squelch control works as you expect and can set squelch to minimum then adjust the volume safely.

- Battery life seems excellent. I used an overnight charge on an external charger before using the supplied AA cells. I got over seven (yes 7) hours use before the low battery warning came on! I was using walkman type head-phones for most of this time (less power used than with the speaker).

- Even with ni-cad cells, there seems to be good low battery warning time. I have noticed there is audio distortion also when voltage is low so this works as another warning!

- I do miss the scan/hold button that was on the AR-1000. There doesn't seem to be a nice simple way to to lock on a channel when in scan mode. The MONI (monitor) button on the side does stop scanning but it must be continuously held. Another way I have found is to press SRCH (search) then SCAN which will put it into non-scan mode without skipping over to another channel. Pressing the SCAN button will work but ONLY if there is no transmission on the channel. I usually just turn the squelch to minimum to lock onto a single frequency as the scanner is usually in my pocket and finding buttons is next to impossible!

- There is a leather case (yes REAL leather) available for the AR-8000 which I do recommend. It has clear plastic windows for access to the display and the buttons (side and front). It does make finding buttons by feel impossible but does provide some protection. It's much more substantial than the plastic one supplied with the AR-1000.

- So far, I havn't been able to figure out the intermediate frequency. I don't think it's 10.7Mhz. Using broadcast FM frequencies, I do find images 12.8Mhz above and below so the i.f. might be 6.4Mhz.

6682. Discone or dipole better?

Newsgroup: rec.radio.scanner
Date: 1994-12-11 23:46:44 UTC
From: maverick@csulb.edu
Message-ID: <3cg314$r3k@garuda.csulb.edu>
Source record: 264337

I would like to put an outdoor antenna on my roof to increase reception for my Pro 2006 scanner. I live in a mid size city and can receive the major public service frequencies no problem with the stock telescoping indoor antenna. I would like to receive the more esoteric transmissions from portable radios like the School District, Community College etc. These are probably 1 watt radios transmitting within a 5 mile radius of me (no repeaters). I would also like to recieve transmissions from a major international airport approximately 50 miles away, as well as military aircraft transmissions from an air force base approximately 75-100 miles away, and 800-900 MHz trunked business systems.

I'm trying to decide between getting the Diamond D130J discone antenna and the Antennacraft Scantenna (I believe this is dipole -array or -cluster design), both sold by Grove Enterprises. If I'm interested in recieving only and never transmitting, which antenna would be superior for my purpose. I notice that the Diamond Discone is twice the price of the Antennacraft Scantenna, does this make it superior?

Thank you very much for your help. And thank you to all the people who have responded to my previous posts, I really appreciate the help. Feel free to email me directly if you'd like.

>

See if your local RS can order one for you. If not, I suppose I could copy
mine. Direct is easy. Pick a channel. Press direct. Then up or down will
scan feom there. Monitor stores frequencies into the 10 monitor channels and
can later be moved to program channels.

6684. POCSAG INFO HERE

From alt.radio.scanners...

The following summary describes the coding used on POCSAG pager
signals and may be of interest to those curious about what those ear-splitting
beeps and buzzes mean and how they encode data. This summary is
based on a very old text of the standard from my files; the current
text of the POCSAG standard is available as CCIR Radiopaging Format 1.

Note that some current POCSAG signals (so called Super-POCSAG)
transmit paging at 1200 or 2400 baud instead of the 512 baud I refer to
here, but use essentially a similar coding standard.

The interested USA reader is reminded that willfully intercepting
other than tone only paging is a violation of the ECPA with similar
penalties and criminal status to willfully intercepting cellular phone calls.

The interested reader is advised that at least two of Universal
Shortwave's RTTY reading devices (the M8000 and the new C-400) are
capable of reading at least the older 512 baud version of POCSAG paging,
so commercial devices for this purpose are currently being sold in
the USA.

And finally, much alphanumeric paging - particularly that installed
some time ago, uses a proprietary Motorola encoding format called
GOLAY which is quite different from POCSAG. The two can be told apart
by their baud rates - GOLAY is 600 baud.

POCSAG

First POCSAG stands for Post Office Code Standarization Advisory
Group. Post office in this context is the British Post Office
which used to be the supplier of all telecommunications services in

England before privatization.

POCSAG as defined in the standard, (original POCSAG) is 512 bits
per second direct FSK (not AFSK) of the carrier wave with +- 4.5 khz shift
(less deviation than that is used in some US systems). Data is
NRZ coded with the higher frequency representing 0 (space) and the
lower one representing 1 (mark).

The basic unit of data in a POCSAG message is the codeword which
is always a 32 bit long entity. The most significant bit of a codeword
is transmitted first followed immediately by the next most significant
bit and so forth. The data is NRZ, so that mark and space values (plus
and minus voltages) as sampled on the output of the receiver
discriminator at a 512 hz rate corrospond directly to bits in the
codeword starting with the MSB. (Note that the audio output circuitry
following the discriminator in a typical voice scanner may considerably
distort this square wave pattern of bits, so it is best to take the
signal directly off the discriminator before the audio filtering).

The first (msb) bit of every POCSAG codeword (bit 31) indicates
whether the codeword is an address codeword (pager address) (bit 31 = 0)
or a message codeword (bit 31 = 1). The two codeword types have
have different internal structure.

Message codewords (bit 31 = 1) use the 20 bits starting at bit
30 (bit 30-11) as message data. Address codewords (bit 31 = 0) use 18
bits starting at bit 30 as address (bits 30-13) and bits 12 and 11 as
function bits which indicate the type and format of the page. Bits 10 through
1 of both types of codewords are the bits of a BCH (31,21) block ECC
code computed over the first 31 bits of the codeword, and bit 0
of both codeword types is an even parity bit.

The BCH ECC code used provides a 6 bit hamming distance between
all valid codewords in the possible set (that is every valid 32 bit
codeword differs from ever other one in at least 6 bits). This makes
one or two bit error correction of codewords possible, and provides
a robust error detection capability (very low chance of false pages).
The generating polynomial for the (31,21) BCH code is x**10 + x**9
+ x**8 + x**6 + x**5 + x**3 + 1.

Codewords are transmitted in groups of 16 (called batches), and
each batch is preceeded by a special 17th codeword which contains a
fixed frame synchronization pattern. At least as of the date of the
spec I have, this sync magic word was 0x7CD215D8.

Batches of codewords in a transmission are preceeded by a start
of transmission preamble of reversals (10101010101 pattern) which must
be at least 576 bits long. Thus a transmission (paging burst) consists
of carrier turnon during which it is modulated with 512 baud reversals
(the preamble pattern) followed by at least 576/512 seconds worth of
actual preamble, and then a sync codeword (0x7CD215D8), followed by 16
data/address codewords, another sync codeword, 16 more data/address

codewords and so forth until the traffic is completely transmitted. As far I am aware there is no specified postamble. I beleive that all 16 of the last codewords of a transmission are always sent before the carrier is shut off, and if there is no message to be sent in them the idle codeword (0x7A89C197) is sent. Later versions of the standard may have modified this however.

In order to save on battery power and not require that a pager receive all the bits of an entire transmission (allowing the receiver to be turned off most of the time, even when a message is being transmitted on the channel) a convention for addressing has been incorperated which splits the pager population into 8 groups. Members of each group only pay attention to the two address code words following the synch codeword of a block that corrospond to their group. This means that as far as addressing is concerned, the 16 codewords in a batch are divided into 8 frames of two codewords apiece and any given pager pays attention only to the two in the frame to which it assigned.

A message to a pager consists of an address codeword in the proper two codeword frame within the batch to match the recipients frame assignment (based on the low three bits of the recipient's 21 bit effective address), and between 0 and n of the immediately following code words which contain the message text. A message is terminated by either another address code word or an idle codeword. Idle codewords have the special hex value of 0x7A89C197. A message with a long text may potentially spill over between two or more 17 codeword batches.

Space in a batch between the end of a message in a transmission and either the end of the batch or the start of the next message (which of course can only start in the two correct two codeword frame assigned to the recipient) is filled with idle codewords. A long message which spills between two or more batches does not disrupt the batch structure (sync codeword and 16 data/address code words - sync code word and 16 data/address codewords and so forth) so it is possible for a pager not being addressed to predict when to next listen for its address and only turn on it's receiver then.

The early standard text I have available to me specifies a 21 bit address format for a pager (I beleive this has been extended since) with the upper 18 bits of a pager's address mapping into bits 30-13 of the address codeword and the lower 3 bits specifiying which codewords within a 17 codeword batch to look at for possible messages. The address space is further subdivided into 4 different message classes as specified by the function bits (bits 12 and 11 of a codeword). These address classes corrospond to different message types (for example bits 12 and 11 both zero indicate a numeric message encoded in 4 bit BCD, whilst bits 12 and 11 both set to 1 indicate an alpha message encoded in 7 bit ASCII). It was apparently envisioned that a given pager could have different addresses for different message types.

There are two message coding formats defined for the text of messages, BCD and 7 bit ASCII. BCD encoding packs 4 bit BCD symbols 5 to a codeword

into bits 30-11. The most significant nibble (bits 30,29,28,27) is the leftmost (or most significant) of a BCD coded numeric datum. Values beyond 9 in each nibble (ie 0xA through 0xF) are encoded as follows:

0xA Reserved (probably used for something now - address extension ?)
0xB Character U (for urgency)
0xC " ", Space (blank)
0xD "-", Hyphen (or dash)
0xE ")", Left bracket
0xF "(", Right bracket

BCD messages are space padded with trailing 0xC's to fill the codeword. As far as I know there is no POCSAG specified restriction on length but particular pagers of course have a fixed number of characters in their display.

Alphanumeric messages are encoded in 7 bit ASCII characters packed into the 20 bit data area of a message codeword (bits 30-11). Since four seven bit characters are 21 rather than 20 bits and the designers of the standard did not want to waste transmission time, they chose to pack the first 20 bits of an ASCII message into the first code word, the next 20 bits of a message into the next codeword and so forth. This means that a 7 bit ASCII character of a message that falls on a boundary can and will be split between two code words, and that the alignment of character boundaries in a particular alpha message code word depends on which code word it is of a message. Within a codeword 7 bit characters are packed from left to right (MSB to LSB). The LSB of an ASCII character is sent first (is the MSB in the codeword) as per standard ASCII transmission conventions, so viewed as bits inside a codeword the characters are bit reversed.

ASCII messages are terminated with ETX, or EOT (my documentation on this is vague) and the remainder of the last message codeword is padded to the right with zeros (which looks like some number of NULL characters with the last one possibly partial (less than 7 bits)).

The documentation I have does not specify how long a ASCII message may be, but I suspect that subsequent standards have probably addressed the issue and perhaps defined a higher level message protocol for partitioning messages into pieces. The POCSAG standard clearly does seem to allow for the notion of encoding messages as mixed strings of 7 bit alpha encoded text and 4 bit BCD numerics, and it is at least possible that some pagers and paging systems use this to reduce message transmission time (probably by using some character other than ETX to delimit a partial ASCII message fragment).

There have been several varieties of this, with brand names of Buddy-L,
Innovations, Eco Charger, and yes ... even Remington (the shaver people).

They really don't do much. What they will do is rejuvenate a very
slightly used alkaline batery. Someone posted a comprison in which he
charged batteries in the Buddy-L and left a control set on the shelf.
There was little difference.

I've played with one of these and it does "top off" the cell, but the
shelf life on the "recharge" is poor and you'd have to recharge each cell
after every light use.

If you want to recharge alkalines, get the Rayovacs and the charger made
for them.

I've had one for about 7 years and it too has been to hell and back and it keeps on ticking.

I'm a newbie to this group and would be interested in knowing what kinds of mods your looking for a Pro-32. i.e. what types of communications would you like to pick up that the Pro-32 cannot already pick-up ? cellular ? other ?

According to the airline I fly (Delta), and I think they took it from
FAA regulations, SCANNERS, that being VHF/UHF receiving units are legal
to operate during all courses of the flight except taxi, takeoff, initial
ascent, initial approach, final approach, and landing. However, amateur
radios, CB's, or personal two-way radios are not permitted at all.

I'm not sure as to why but there always seems to be a lot of irrational
fear in using handhelds on planes. No scanner is going to cause the
airplane to crash! The worst that can happen is that you will interfere
in the VORTAC or GPS systems (unlikely). If that were to happen, they
may experience some intermittent problems with their navigational
equipment only. If that were to happen, I would expect them to ask
passenger's to turn off lap-tops and Walkmans. Critical systems are
designed to be immune to low level EMI.

The FAA regulations are a direct result of some accident being blamed on or
a pilot complaining of EMI interfering with the airplane's avionics. The FAA
will usually take the over-cautious position and ban anything even remotely
suspected of causing a problem.

>I hope we never share an airplane! Signals from the scanner can screw up
>the airplane's systems and you could die.

NOT.

I find it hard to believe considering:
- Scanners do not transmit and the amount of RF that they could
emit is regulated to pass FCC regulations before product release.

- Certainly a laptop computer emits more RF. Try listening to your
walkman next to one. (at least mine)

- The airlines are merely taking precautions when they tell you to
turn off all electronic equipment during takeoff and landing.
To my knowledge there has never been an incident concerning this.

Please correct me if I am wrong on any of these...

Jeff - Who is planning on scanning his next flight this week.

: I would like to put an outdoor antenna on my roof to increase
: reception for my Pro 2006 scanner. I live in a mid size city and can
: receive the major public service frequencies no problem with the stock
: telescoping indoor antenna. I would like to receive the more esoteric
: transmissions from portable radios like the School District, Community
: College etc. These are probably 1 watt radios transmitting within a 5
: mile radius of me (no repeaters). I would also like to recieve transmissions
: from a major international airport approximately 50 miles away, as well
: as military aircraft transmissions from an air force base approximately
: 75-100 miles away, and 800-900 MHz trunked business systems.

50 miles is pushing it, for VHF frequencies - 75-100 miles is unlikely,
unless they are using lower frequencies. You might be able to receive
the aircraft transmissions however.

Remember that most frequencies that can be received by scanners are line
of sight.

: I'm trying to decide between getting the Diamond D130J discone antenna
: and the Antennacraft Scantenna (I believe this is dipole -array or
: -cluster design), both sold by Grove Enterprises. If I'm interested in
: recieving only and never transmitting, which antenna would be superior
: for my purpose. I notice that the Diamond Discone is twice the price of
: the Antennacraft Scantenna, does this make it superior?

A dipole will have gain over a discone, but will not be as broadbanded.
The dipole will receive frequencies for which it is not tuned, but at
a reduced level.

Bill

6701. Mod for Bearcat 2500XLT wanted.

Newsgroup: rec.radio.scanner
Date: 1994-12-12 06:05:17 UTC
From: stahara@xlate.hsc.usc.edu
Message-ID: <3cgp6t$gj1@xlate.hsc.usc.edu>
Source record: 264361

Can anyone help? I downloaded the mod from oak.oakland.edu
which mentioned that there are two circuit boards for this
model. The mod described the modification for only one. I
am assuming that I have a later version BC2500XLT. Is there
a mod or am I SOL?

Would appreciate any help.

Thanks in advance.

It is acceptable to start up your laptop or walkman during the flight,
just not during the takeoff or landing, but I would be more cautious of
scanners (or any reciever) because of the IF frequency. I am not sure if
it would cause any problems, but I would rather not give the pilot any
other things to worry about.

D>Is this legal? Is this interesting? What's the easiest way to gather
>freq's for a trip? Thanks for any replies..! :-)

It's legal on some airlines, and on some it's not, what's interesting is
they all site the same FAA rules as to why they do or don't allow it! I
know Delta allows it, but only after they are airborne at cruising
altitude. You should check with the airline your flying on.

It's interesting if you like to listen to aviation freqs.

You could always scan 108-136 mhz, or if you have a pilot friend you
could see if she or he will provide you with some freqs.

I fly Delta so I do some monitoring to pass away time on long flights.
Also being so high so you can pick up lots of different bands.

Good Luck,

John Stone

>Dispatcher: Who's got the bat? Is he white, black or Hispanic?
>Caller: There's a man with a bat ...

Is this what the fuss is all about? I read through the transcript of the
Phila 911 tapes and quite frankly I don't see any examples of excessive
rudeness. All I get here is some poor police dispatcher telling a caller
not to be rude. 911 dispatchers have to deal with all kinds of people in
a course of a shift and have to calm down the excited ones to be able to
extract the important facts from them. This transcript makes me wonder why
the police didn't show up a lot earlier. Of course, in Philadelphia, they
may have more urgent business to take care of. All I know is I'm glad I
don't live anywhere near Philadelphia!

I recommend you call the store and ask for the name/number of the district office. Disciplinary matters like this are best handled as close to the source as possible. If you really want to talk to someone at HQ, you can call Radio Shack Customer Relations (817-390-3200). They will certainly know the specific party who should hear your complaint.

I have been using two Radio Shack Discones for about 5 years. One on my RS-2004 and the other on my Kenwood
TM-741 ham tranceiver. I have tried "multiple-diople" scanner antennas (and the equivalent on 3-30 mhz). The antenna truly designed for 'broad-band' operation always works better. The "multiple diople" design will have significant loss of received signal in the 'gaps' between the dioples resonant frequencies. The 'broad-band' antenna (discone in this case) will generally perform much better as the 'bandwith' is typically a 10:1 ration (100-1000mhz+) with essientally a flat swr of 1.5:1 or less. This translates to effectively using your scanner

over a broad range of frequencies with far better results in the frequency ranges you want to listen to (not to mention the ones you have not discovered).

My suggestion is to buy the discone antenna and start enjoying decent broadband reception.

Regards........Gary (garyposs@bga.com)

I'm currently reviewing a PRO-2035 for the National Scanning Report. So far, I like it. It has a few drawbacks, but all in all it is a fitting replacement for the '2006. If the OptoScan 456 board will work or can be modified to work in the '2035, so much the better. As far as mods go, there are no mods to open up 800 MHz coverage; that is locked inside the micorprocessor and cannot be altered (in line with our government's nasty policy of telling us what we can and cannot listen to, even though the airwaves are public. I remain convinced that if someone wants to keep a radio transmission private, it should be encrypted).

You could do a lot worse than the PRO-2035. It far surpasses any similar product offered by any other manufacturer.

I have to agree with the former NYC 911 operator about the life of a 911 operator. I am a police/fire dispatcher for a wealthy suburban municipality. Instead of the stuff he got, I get to deal with snotty rich people who are ticked off that the neighbor's dog is peeing in their yard and other such fun things. In addition, I also do everything when I am at work.....Police Radio, Fire Radio, 911, regular phone lines, etc. It really gets fun in bad weather when 6 phone lines are ringing at once, plus 2 911 lines, and both the Police and Fire radios are blaring away (not to mention the monitor radios with which we monitor surrounding areas).

Then, top all this off with a possible heart call on 911 where I have to explain CPR over the phone AND send the appropriate fire apparatus.

Next time you call the police or fire department, tell the operator "Thanks" for doing a great job, enduring outrageous amounts of stress, and giving up their holidays to help you.

If your local NWS/NOAA office has recently been moved elsewhere, or if you have one of the new consolidated NWS offices in your town, you are hearing the link from the NWS office to the remote 162 MHz transmitter. Each individual transmitter has it's own link frequency, since each transmitter covers a different area and requires different audio feed.

Oh please. There is a BIG difference between a dispatcher asking a caller
to calm down and saying things like "if you don't calm down he doesn't get
any help." The 911 dispatchers in this case acted in a near criminal manner,
not to mention their arrogance and rudeness. I must say, if I was the father,
brother, or friend of the victim who died due to their pathetic job
performance, they would not only have lost their job due to that incident.

6724. Antenna identification

Newsgroup: rec.radio.scanner
Date: 1994-12-12 20:02:37 UTC
From: wmeranda@vnet.ibm.com
Message-ID: <3cia8t$183r@sernews.raleigh.ibm.com>
Source record: 264282

Since I started scanning about a year ago I find I'm starting to notice
various antenna towers that used to be just part of the invisible landscape.
I suspect that I'm starting to loose touch with reality because I find
myself wanting to be able to identify the antennas and their use. Anyone
know of a good source of information for this ?

Some new towers going up in my area have me wondering, they are somewhere
between 50-100 foot tall on a metal hexagon tower that gets gradually
thinner with height. There is a triangular platform at the top with
a single vertical whip at each corner.

Thanks
Wes Meranda

6725. discone vs scantenna

Newsgroup: rec.radio.scanner

Message-ID: <12DEC199415214569@vax2.concordia.ca>
Source record: 264284

For scanning, I would choose a discone over any other
antenna because of its broadband capabilities. When comparing
discones, check Radio Shack. They have 2 versions: 1) about
50-1300 MHz coverage with little gain if any for under $20;
2) an excellent one with 25-1300 MHz coverage and ample gain.
This one is at the same level of quality as the ones shown in
the Grove and National catalogues, but at $60 it is a steal.
I just got one and am very pleased with the results, even though
I'm using it on the ground floor balcony for now (in this part
of north america the temperature just dropped to -20 degrees and
we had 26 centimeters of snow, consequently I can't find someone
brave enough nor stupid enough to go up on the roof to install
the antenna).

My experience has been to pre-board when they first offer it, and ask the pilots as soon as you get in the plane. (this way you won't hold up others as they fight for overhead bin space, just tell the gate agent you are going to talk to the pilots, they usually won't question your getting on early.) Usually if you explain(to the pilots) that the scanner does not xmit, they will give the freqs to you right there. I once had a Continental pilot give me the freqs (in order) that we would be using for the whole flight i.e. ground, tower, departure, Denver Center, LA Center, LA Clearance, LA Arrival, LAX tower, LAX ground. It can be done, it just depends on how persuasive you are. Also, once you get permission from the pilot, it's fun to be able to tell the FA's that it IS ok for you to run your scanner, because the pilots gave you their ok!

Good Luck!!

Richard

probably; sometimes the transmitter keys the mike too late or a
voice-activated switch is a little late. I hear that a lot from
out local police dispatcher, and I've always thought it to be
a little informal. I'd expect more to hear 10-4, "received",
"copied", or the spock-like "affirmative"..
Is police-talk getting less formal?????

From: mgarrett@prairienet.org
Message-ID: <3ciggo$lns@vixen.cso.uiuc.edu>
Source record: 264296

Sometime ago I read a thread on how to get a Bearcat 210XL to scan frequencys not designed in the radio. The following will allow you to scan the 210XL between 50 and 144 MHZ but the radio will cut out after 54 MHZ to around 137 MHZ (as noted in my radio) Here's how to do it.

First select a channel position for the serch. Press "manual" "50 limit", and "50 limit". Next press "search", "hold" and "manual". Next, press "144 limit" and "143 limit" (display will read error). Press "search" and the radio will begin scanning above 50 MHZ. To enter any recieved frequency into the radio's memory, press "manual". It may be best to slow the scanning speed of the radio down so that you can hit your favorite frequency.

I origionaly saw this in Popular Communications, April 86 in the Scanner Scene column by Chuck Gysi, N2DUP. It does work and has added the ability for the scanner to monitor the 6 meter fm calling frequency of 52.525 MHZ so now I can tell when 6 is open without extra radios operating.

Totally a precaution and not because of actual facts...

Just think about it.. Right after takeoff but before leveloff it is then ok to
turn on ANY electronic device. (They tell you this) You have executives
in first class - the compartment closest to the cockpit - using laptops
the leakiest devices other than cellular phones...

(Always check with the flight crew if you want to scan - take precautions)

>You won't find CTCSS on trunked systems (except on the inputs in some rare
>instances to solve co-channel problems). Everything is controlled by
>computer; there is no need for CTCSS or DCS or any tone signalling.

There are tones used in trunked systems for signalling. We have a type I that transmits a continuous connect tone on an active channel at 105.88 Hz. The radios (mobiles/handhelds) burst 1800 Hz acknowledge tone to indicate they are on an assigned channel. There is also 164.64 Hz disconnect tone burst when the PTT is released. Other tones are used for various functions and there are continuous data handshakes that go on during a contact.

You are correct that no CTCSS type tones are needed. Co-channel users can't access the system since the central controller won't recognize them. The signalling tones are the same for all users on the system and problem wouldn't be useful for a scanner.

>Is this legal? Is this interesting? What's the easiest way to gather
>freq's for a trip? Thanks for any replies..! :-)

It depends - Federal Aviation Regulations part 91.21 prohibits the use of portable electronic devices on board airplanes with certain exceptions.

Four clear exceptions are listed in the FAR for things such as hearing aids. The fifth exception is for items determined by the operator (the airline company) to present no hazard. Do not confuse the power of the "Pilot in Command" with the "Operator/Certificate Holder". If the airline's policy does not to allow the use certain devices the PIC can't just ignore that policy and say it's OK. The FAA requires operators to make the determinations of what devices can and cannot be used. Using a scanner if the airline or PIC prohibits it is a violation of federal law.

I have posted the text of 91.21 before and would prefer not to type it again. Additonal information can be found in Advisory Circular 91.21-1, which I have scanned into a text file.

Frequencies can be found in the Airport/Facilities Directory (AFD). They cover different regions of the country. They are published by the goverment and updated four or five times a year. AFDs cost about $3.50 and are available at most "Fixed Base Operators" that sell pilot supplies at your local airport.

(This has been discussed before. I have some FAA reference material but my barebones news reader will not import text file into postings. I can email this material to anyone that is capable of posting it - or just wants to read it.)

Every policy statement I have ever seen from airlines say that NO
electronic device WHATSOEVER except tape recorders/players may be operated
and ANY point during the flight. This is what PSA, United, and AirCal used
to print on their ticket envelopes in small print.

A safe way you could adjust volumn level is to press the monitor
button while truning the volumn knob from low to proper level.

Interesting that you hit on same thing that bugs me. Where is the manual
hold control when in scan mode. I have been tapping the 2-vfo button
to return scanner to basic known state and then tapping the scan button
only once to put it in scan memory recall mode with my last scanned channel
visible. Anyone else have a better idea?

Some leather cases can cause abnormal wear and tear on a radio due
to rubbing and friction. I use the neoprene cases that are sold
for ham radio ht's. These look like wet suit material and provide
1/4 inch material to cushion ther radio from banging around.
Cost is about $15. My Pro 43 Alinco and now this HT type scanner

all take the same size case. Makes life nice! :>)

Those radio shack cases suck!

I have been seeing alot of mail on the BC200XLT battery life being short. I must be one of the lucky ones. My 200XLT always lasted 8+ hours. However, I recently bought the BC2500XLT and am very dissappointed in the battery life of this unit. I am lucky if the battery last me 4 hours!! Please, if anyone knows of a mod for this radio to extend it's battery life let me know!! Any other mods (other than cellular restoration, already completed) for this radio would also be appreciated.

Happy Scanning,
Bob W

Hmmm very interesting. It will be nice to look at what the difference is.
Maybe all they give you is one flat wire cable that would stop
cloning for a few minutes while you figure out that you could
roll your own after a visit to the parts place.

Speaking of software, I have been looking at the adds for some
of these $200 packages that allow you to have up to 1300
logings a minute etc. I figure that I can do the same thing
with procom plus 2 scripts for windows and have loggings
approaching 1800 a minute with the features of the AR0000.

I have already made a short script that allows me to program
and entire bank in about 4 seconds and then read all of it back
(another 2 seconds). I am not a programer but I can reason
out what needs to be done and then look at what tools I have
to do it with until it is accomplished. If there is any interest
I am willing to work with any on a scripting project that
duplicates the features of the big buck software but uses
the tools already available that most have.

For the IBM PC I believe that PROCOM PLUS version 2 for Windows
is a good choice because it comes with a powerful scripting
lagunage, compliler, and debuger. Supports the capabilites
of the windows gui interface and could be made to be really
attractive looking with a little extra work. It also supports
OLE which means that you can link it to EXCEL worksheets for
automatic data manipulation as it is received. There may be
other similar progams that others have for windows or their
respective platforms. The research on the AR8000 rom
was done by a fellow with a MAC and some scripts he wrote.

Any opinions from others?

Vic Healey ki4je
vic@ping.com vhealey@crl.com vh@ping.com

PS
Anyone else want to mangge an information list for the AR8000?
I can see tht this can become unmageable by hand. I will forward
a list of all current interested individuals to you.

DctrHappy (dctrhappy@aol.com) wrote:
: I think the airport is Orlando international..?? But does anyone have any
: police/fire/airport/airplane (each or all) for the Orlando area? Help is
: much apprec..!!
: Thanks-!

If you are looking for the frequencies for ground operations at Orlando
you'd be looking at:

Channel 1 453.300 (Police)
Channel 2 453.100
Channel 3 452.850
Channel 4 460.600 (Fire)
Channel 5 453.525

Delta Airlines - 460.825 and 460.875. That's my contribution... There
are many frequencies at the airport, car rentals, etc... Have fun!

If you meant Orlando in general:

Channel 1: 460.050 Teletype
Channel 2: 460.100 East
Channel 3: 460.400 West
Channel 4: 460.450
Channel 5: 460.425 Service
Channel 6: 460.425 (Talk-around short range channel 5)
Channel 7: 460.075 Car to car
Channel 8: 460.150 MBI (undercover, drug deals etc)
Channel 9: 460.250 FDLE UHF (not sure -- I think this is 9 on some radios)

Orange County (where Orlando is located) has over 100 frequencies assigned to
it, 40 are 800 mhz trunked!

In article <D0D3qu.C0L@wang.com>, dbushong@wang.com (Dave Bushong) writes:
>Oh, great. Now these people who deal with life and death have to be
>politically correct, too.

It had nothing to do with being politically correct. This was a case where
the chose not to deal with a life and death situation. This was a case where there were 19 telephone calls for help. The 911 operators were rude and unhelpful, had to be told the location multiple times because it appears they did not understand English, and waited 40 minutes before dispatching any police. At least one of the operators received three calls
about the incident. When the dispatchers did finally send the police (40 minutes after the first call), they did not convey all of the information correctly and were critical of the callers lack of information which, the tapes show, actually was correct and sufficient. It turns out that because
the location borders on two precincts, that there were actually many police available and just minutes away. But they were called too late. This has nothing to do with political correctness. This is a case of 911 operators who forget where their salaries come from.

>Look, jerk (not you, the guy who posted, but 'you' as in 'people who
>get upset that 911 operators aren't so polite'): Someone calls, says
>someone is getting beat up. 911 op calls the cops. Job done.

Job not done. It appears that you are the jerk. These 911 operators did not call the cops until after 19 calls for help and 40 minutes.

>No one expects her to be sympathetic, understanding, kind, or anything
>other than accurate. If you want to gripe about someone, then you
>should go after the guys with the baseball bats who were causing the
>problems in the first place.

The guys with the baseball bats were the root cause. But this is an incident which could have been prevented, but wasn't. No thanks to some 911 operators. If I managed that outfit, I'd be cracking some heads together.
It appears that a number of the operators have been fired and rightly so.

Hello,

I have been out of the scanning world for a while, but I just bought myself one of the last Radio Shack Pro-2006's in these parts. No I haven't opened it up to see if it is modifiable for cell phone scanning, but I assume it is. I also just put up the cheap Radio Shack scanner antenna, I used about 36 feet of RG8/Mini to do it. In the future I'll buy a better antenna.

Anyway, I was looking for some of the interesting freq's to scan. I have some of the Pittsburgh police, fire, and EMS. But what is the mysterious channel 7? Only one fire/ems dispatch freq?

How about the college police freq's (Pitt, CMU, Carlow, Duquesne, Chatham, etc.) Any college EMS freq's (I think CMU has a student run EMS)?

Any other interesting freq's here in the greater Pitt area? After all I have 400 spots to fill!

Thank you in advance

GEnie R.Baker70

You may have noticed there is an addition to the masthead. I can now be reached via the GEnie system. If you would like to subscribe to GEnie, Glen Johnson, the Radio Round Table Sysop, has made me aware of a special offer. Set your communications software for half-duplex (local echo) at 300, 1200, or 2400 baud. Dial toll-free in the U.S. at 1-800-638-8369 (or in Canada, 1-800-387-8330). Upon connection, type HHH. At the U#= prompt, type JOINGENIE and press <Return>. At the offer code prompt enter MKC524. This offer code gets you onto GEnie for a monthly fee of $8.95, which includes 4 free hours of connect time (non-prime time) per month. After that, its $3.00 per hour. The sign-up code will get you $50 worth of usage (about ten hours) the first month at no charge. By downloading the GEnie communications program Aladdin you can really make 4 hours go a long way. This slick software jumps on and downloads new mail and posts in your area of interest and logs off in under two minutes as a rule. Mail replies and posts then are done off-line.
I've been looking around and they have a nice shortwave area that is divided into many areas of interest, not just the ute's! So this is a offer any Speedx'er may take interest in. If you need more information, contact GEnie Client Services at 1-800-638-9636.

NIOZ, The Netherlands
Jan Nieuwenhuis, a member of Benelux DX-club in The Netherlands and editor of the BDXC club-bulletin columns "DX-Hotline", "Publications" and at times "Specials", was nice enough to send me some information for the organization he works for, NIOZ. NIOZ is the Netherlands Institute for Sea Research. NIOZ is very much similar to NOAA here in the U.S. or the Bedford Institute in Canada mentioned in this column before. NIOZ is headquartered on Texel Island in The Netherlands.
The pride of NIOZ is the R/V Pelagia, callsign PGRQ. Built in 1991 and with a gross tonnage of 1553 tons, she has a blue hull and white super structure with orange trim. Really a beautiful vessel. Another ship operated by NIOZ, but not presently in service, is the R/V Tyro.
NIOZ is involved heavily in ocean research, and experimentation in Greenland, the NE Atlantic Ocean, Indian Ocean, Mediterranean Sea, Black Sea, Scotia Sea, and Antarctica to name a few locations!
If you should happen to log the Pelagia or the Tyro, drop Jan a line c/o: Vloedlyn 12, NL-1791 HH Den Burg (Texel), Netherlands, and he'll make sure that your QSL request is taken care of.
Now Jan also happens to distribute a software program for those ute's involved in facsimile reception. It's called WEFAX. Jan sent a full featured version of his software for me to review. Requiring a 286 or faster, with DOS 3.0 to 6.0, to run on, this is a weather facsimile data base with all kinds of info. Easy to use and menu driven, this software has a lot of options to

make catching or ID'ing FAX charts a lot more easy. Options include info display or report by frequency, by station, by callsign or country. Transmission times, power, and drum speed with index of cooperation (IOC) settings are included. A Station Information menu includes addresses and times of transmission of specific charts. Jan says every weather facsimile station in the world that transmits on longwave or shortwave has been included. Not sure what a "surface analysis" chart looks like? No problem, sample charts can be displayed also. It's a very impressive little program and in English too! Updates are also available.
Paying for the software is (perhaps) a little problem. The price of the WXFAX program is 25 Dutch Guilders (US$13.00). Lacking Dutch Guilders to pay with, you can send U.S. Dollars but then you have to add US$1.00 for conversion to Dutch money again. If you want to pay by check, it's best to use a International Bank draft order. Be sure to state that you need to send the equal of 25 Dutch Guilders. Prices include airmail postage worldwide.

RD Reviews "Hobbyist's Guide to COMINT Collection and Analysis" by Tom Roach
An interesting review this month and a change of pace from your normal "utility" book. Tom Roach, a longtime utility digital and SSB mode/broadcast hobbyist, has authored and published this title.
"COMINT" is a military acronym for "Communications Intelligence", or the gleaning of information from communications. You have seen examples of this month after month in this very column! When you hear a certain aircraft say "switch to frequency Z32" and you tune around and find the same aircraft calling his station of "Z32", you have engaged in COMINT. You now have determined by an intercepted communication that frequency "XXX" is designated "Z32", for a simple example. Sometimes you may see a oddly formatted message sent from one particular station and wonder what it is and how you can figure it out.
That's some of what Tom Roach explains in this book.
The book is some 100 pages spiral bound; a format I admire in a radio hobby book as it makes it easy to sit down on a page you want to keep turned to, no page weights required!
Stressing HF comms and using Russian and Cuban RTTY/CW traffic as an example, Tom gives the reader his "lessons" which can be applied to any aspect of the monitoring hobby, including VHF/UHF/800Mhz scanner traffic. Myself, I have been involved in the "ute's" and scanners for a long time and have "gleaned" my share of information. But I was still fairly amazed at some of methods that could be employed to solve "radio mysteries".
Chapters cover needed equipment; where, when and how to listen; and the proper analysis of data. It is this last area, analysis, that never has received any real attention in any publication before. All the analysis lessons here uses REAL intercepted traffic.
I think those who are involved in military monitoring of any kind, and digital modes, will find this book of interest. The "Hobbyist's Guide to COMINT Collection and Analysis" by Tom Roach is available direct from the author at 1330 Copper Peak Lane, San Jose, CA, 95120-4271 with a cost of US$24.00 U.S. and Canada, US$26.00 for UK, Finland, Germany, and US$27.00 for Australian readers. The book should be available through Universal Radio and Groves' shortly. All orders direct include air mail shipping, but no credit

cards accepted. And by the way, Tom is also a fellow Speedx member so if you order direct, ask him to sign your copy!

MARITIME
Robert Hall, our main man in Capetown, RSA, checks in this month with the burning question...

Where have all the Russians Gone? by Robert Hall
Since I began with RTTY some five years ago there have been many changes, in particular the reduction in Press transmissions. Where once one could find TASS on a dozen frequencies at almost any time of day, now we have to make do with the deadly dull stuff from KCNA Pyongyang, MAP Rabat or the absolute pits ATA Tirana and XNA Beijing. For those seeking intelligible news there is still ANSA Rome and MENA Cairo outs out a reasonable bulletin now and again. But RTTY listening seems not so nearly interesting today as it was three or four years ago with the big agencies using Satcomm's.
But when the bands seemed dead there has always been an alternative of tuning the Russian Merchant Marine communications. With well over 6,000 ships operating on certain narrow frequency bands, and invariably at 50/170 speed/shift, there has been no difficulty in logging different ships and callsign's throughout the day. Signals come in rather strongly from as far afield as Murmansk and Vladivostok, and there is always a good deal of traffic in the Black and Caspian Seas, mostly around 22.360 Khz. But they are a lot more difficult to find nowadays.
The Russians have a signal book of free transmissions for sailors which follows somewhat formal and endearing themes..."I kiss your hands and feet Ekaterina Plisetskaya", etc. But perhaps the Ekaterinas, Svetlanas, Nanushkas, and Olga's are going without their goodwill messages nowadays. Or maybe the Russian shipping has re-equipped with Satcomms's? But this seems unlikely considering the current state of their economy.

I can now expose the above as complete bunkum having logged no less than 10 Russian ships sending hugs and kisses within 30 minutes, all between 16790 and 16803 Khz and during their Sunday lunch between 1200-1230 GMT/UTC. So now we know where the Russkies are!

Thanks Robert. Yes it seems even the Russians (et al) are being affected by the continuing down-swing of the solar cycle. As Robert said, lots of ships and always interesting providing you can translate Russian. There are books out there that help. First, is the USSR Merchant Ship List by our own Jason Berri. Gives ship names, callsign's, and hull ID numbers as well as a introduction and information on finding and monitoring the Russian fleets. A very helpful book to get you going. Then we have The Soviet Maritime Radioteletype Dictionary edited by Gary Gorka with an introduction by Fred Osterman. Gives the Cyrillic and Latin-shift transliterations of commonly found words. Both of these useful books are available through Universal Radio. Here in Ohio, I've had great success 1900/2200 UTC between 16780 and 16804 Khz; 2000/0000 UTC between 12558 and 12572 Khz; and 2100/0200 UTC between 8393 and 8413 Khz.

This must be Russian Monitoring Month (hi!) as we also have some information sent by Tom Roach (CA). As some of you may have read, the Russian

government is attempting to take steps to seal the submarine Komsomolets. The Komsomolets, known to NATO as the Mike-class, was a Soviet Navy Nuclear Attack Submarine built as a test-bed but considered fully operational. While cruising in the North Atlantic, she suffered a fire in her aft most compartment. She surfaced, but subsequently flooded and sank on April 7, 1989, 112 nautical miles southeast of Bear Island, Norway, killing 42. She lies in 4,900 feet of water with a pressurized water reactor and two BGTs, or nuclear armed torpedoes. She became the focus of concerns over the last few years, as it was feared that nuclear materials may escape and destroy fishing grounds. The Russian expedition with NIS Akademik Mstislav Keldysh was the first to attempt to deal with the problem.
Tom snagged a nice intercept from the NIS Akademik Mstislav Keldysh. Not heard from in quite a while, she is near Panama, headed for Germany. The ship is operated by the Russian Academy of Sciences from Kaliningrad, and used her two Mir submersibles to place nine seals on the bow of Komsomolets. The seals covered the six torpedo tube openings and three hull fractures. Here is some of Tom's captured text:

Have arrived to the research site (Russian, "poligon") in the
center of Atlantic ocean. Today is the 7th (day of the month).

YUBL OBNIMAYU TSELUYU=IGOR'
NNNN

Thanks to Tom for sending that snag. Lastly, I have confirmed UIW is Kaliningrad Radio, UGC is Saint Petersburg Radio, and UGW as Novorossiysk Radio. More changes should be coming as the former Soviet Union continues to emerge as 17 or so republics or nations, all with new callsign allocations mostly from the old Soviet Unions blocks!

M/S Regal Empress, a 22,797 ton cruiseship owned by Regency Cruises, caught fire while moored in New York Harbor on August 20. Loaded to capacity, the ship returned from a five-day New England cruise when a fire started. The ship was evacuated, with 12 passengers and six fire fighters injured. There is no word on the extent of the damage. Regal Empress was just refitted last

year. That's all she "wrote" for this month, we'll try it again next month!
DE RD
==========
Note: This is the Dec. 'Electronic Edition' and is from the Oct. 1994 SPEEDX member bulletin "Shortwave Radio Today", ISSN 0882-8091. SPEEDX utility coverage now consists of three columns:

UTILITIES: Edited by Mike Wolfson. Logging's, frequencies, and schedule information. Contributions in these area's can be sent to Mike.

UTILITY NOTES: Edited by Rick "RD" Baker. News and information about the world of utilities, and utility stations. Contributions in these area's can be sent to myself.

UTILITY VERIFICATIONS: Edited by Tim Braun. "UTE" only QSL's and Verifications. QSL info. I hope to add Tim's column to the electronic edition soon.

SPEEDX members had this information over 2 months ago! If you would like to recieve this information as quickly as our members do, SPEEDX publishes a monthly DX bulletin of around 43 pages, Shortwave Radio Today (ISSN 0882-8091). Some of the other column's include:

THE DXperience: Focusing on notes,news,and views of what's happening in the exciting world of Shortwave radio. Edited by Dan Brame

TRASH & TREASURE: Information on catalogs, freebies, promotions, and SWL related items. Edited by Donald F. Weber

WHAT'S ON: A program listing, and some freqs for SW Radio edited by Daniel Sampson. (73540.3025@compuserve.com)

SHORTWAVE TO GO!: News and information on shortwave broadcast stations. Edited by Richard E. Hankison
WESTERN HEMISPHERE: SWBC logging's column edited by Don Thornton

EUROPE: SWBC logging's column edited by Tim J. Johnson

THE COMMONWEALTH: SWBC logging's column edited by Bruce Robinson

AFRICA: SWBC logging's column edited by Paul Wakefield

ASIA/OCEANIA: SWBC logging's column edited by William Westenhaver

QSL REPORT: a QSL reporting column edited by Michael Fanderys

SPEEDX AWARDS: A wide variety of awards are available for members DX'ing accomplishments, Harold Woering, Awards Chairman

....and more!

If you would like to learn more about the SPEEDX radio club,
(the Society to Preserve the Engrossing Enjoyment of DX'ing), a
Non-Profit ALL Volunteer hobby organization founded in 1971, please
write to Bob Thunberg Business Manager, SPEEDX, P.O. Box 196,
DuBois, Pennsylvania, U.S.A., 15801-0196. Club dues are as follows:

USA and Mexico $23.00
Canada (AO Airmail) 25.00
Central/South America, Caribbean (airmail) 29.00
Europe (AO Airmail) 33.00
Africa/CIS/Asia/Oceania (AO Airmail) 37.00
Outside North America (Surface Mail) 23.00

All prices are in US funds. Tell Bob you heard about us from the
Electronic Edition!

6769. Looking for a scanner

Newsgroup: rec.radio.scanner
Date: 1994-12-13 12:20:31 UTC
From: lalee@freenet.vancouver.bc.ca
Message-ID: <3ck3if$qdn@freenet.vancouver.bc.ca>
Source record: 264380

Well, I attempted to search out a FAQ for this but was unable to locate one so I'll just start out...

(1) I remember when I was 10 years old or so and my friend just got a scanner... We used to listen to all the diffrent channels listening to the police, airport and such... Well I guess reading this newsgroup has regained my intrest in this hobby...

(2) Is Radio Shack probably the best place to start out for a scanner? I remember looking at a few things in the RS ads but no real searching. Any brands, models that would fit my needs for just general scanning.

Thanks.

Subject: Fun fly

The fifth annual MARYLAND HELICOPTOR FUN FLY will be
June 10 and June 11, 1995. The event will take place at the
MHA field, located 15 minutes from the Washington DC beltway.
As usual, we will advertise and announce this event in Rotary
Modeler Magazine, AMA, and as many club newsletters as
possible. Please help us by including this event in your club
newsletter, or announcing the event to your friends.

More info for direction please e-mail to:

Wayne, MHA (wdhille@aol.com)

6771. Best Price for a Pro-43

Newsgroup: rec.radio.scanner
Date: 1994-12-13 12:59:54 UTC
From: jd13@ukc.ac.uk
Message-ID: <564@kiwi.ukc.ac.uk>
Source record: 264382

Hi,
I would like to try scanning as a new hobby and I am looking to buy an inexpensive entry level scanner. The only shop that sells scanners in the small city that I live in is Tandy and the most likely one for me to buy is the Pro-43 at 250.00 UKP (US$333.00). Is their a mail order company where I can get a Pro-43 (or a similar) scanner for a better deal? Better still are there any mail order meachants that sell used scanners.
Cheers.

6772. Scanning Questions

Newsgroup: rec.radio.scanner
Date: 1994-12-13 13:02:58 UTC
From: fa419@cleveland.Freenet.Edu
Message-ID: <3ck622$2tq@usenet.INS.CWRU.Edu>
Source record: 264383

I have a couple of questions about scanning that I've not been able to resolve...

1. Why do Police and Emergency Care dispatchers often sign their transmissions with the time. Are they time stamping a recording? Is it just custom?

2. I live within 5 miles of a medium sized airport but between 118 and 136 AM I only hear the occasional one sided conversation from aircraft... where is the tower?

3. I've only hear one transmission in my area that was strong but not readable (Ok, so there have been a lot but I think something is UP with this one!) and am not sure if it was SSB or Speech Inversion. Anyone brave enough to describe the two in text? BTW, this was in ~154~ MHZ Local Govt. Band.

4. Last one. When a local AM/FM/TV station is doing a remote broadcast, the remote can be heard in ~161~ or ~450~ areas as Auxillary Broadcasting. Fine. Between the broadcasts, one can hear the remote people coordinating with the station, but not the other side. Any ideas (I know how general this is but who can afford to be specific about a topic like this?) as to what bands a station might use? Business? A telephone connection? (not likely)...

Thanks and forgive the spelling
problems, lack of a usable editor
has turned me into a cretin.

Mike

5. What is a cretin?

> walkman next to one. (at least mine)
>
> - The airlines are merely taking precautions when they tell you to
> turn off all electronic equipment during takeoff and landing.
> To my knowledge there has never been an incident concerning this.

Scanners are not intended to radiate, but fall into the FCC category of "unintentional radiators." Most scanners have broad, untuned front-ends which are prone to unintentional radiation of the local oscillator, which is offset from the desired RF by the IF. The FCC limits this emission to a level acceptable for the scanner's most common locations of operation -- residential and commercial locations. This level may or may not be acceptable for a public safety situation.

While laptop computers also radiate, remember that when you are scanning aircraft frequencies, the most likely frequency you are causing interference to is also in the aircraft band! The laptop will radiate junk, but maybe not at critical frequencies.

While I agree that the airlines are taking a conservative stand, I also feel that most scanners have poor isolation characteristics, and I centainly do not trust them to be safe in such environments without testing each unit before flight. Since the crew doesn't have the means to test them, it's easiest to turn them off.

Don't get me wrong, I am a scanning enthusiast myself. But I also think that the electronics that we are being sold are largely junk, and really could be improved by orders of magnitude if we insisted on it. (Asbestos suit now in place.)

Let's not re-hash this thread of scanners on airplanes any more. It has been done to death.

Hello, no problems with my ic-r100, works great. Your scanner must have been
in a bad batch. Good luck,

It sounds like a absolutely stupid idea to me. And would also be illegal. I
have no problem with people who want to scan the cellular service - just keep
what hear to yourself and you can be sure that eavesdropping prohibitions
won't effect you. When you start manipulating a transmitter for
intentional, unauthorized operation and cause interference is when I start
supporting the big dollar penalties the FCC likes to dish out.

To be fair and answer your other question, yes, most phone have service
modes that bring up the transmitter on specified channels. Some require a
test connectors to be installed (eg. Motorola), others can go to test mode by
using special password commands (eg. Mitsubishi, Oki). The manufacturers
intend to keep those passwords among qualified service people.

Message-ID: <marcbg-1312940808340001@net63.metronet.com>
Source record: 264385

For a discone antenna, the BEST coax to run is 9913, which could be expensive and hard to work with, but it is the best, especially if you have a long run. Additionally, 52 ohm or 50 ohm is of little consequence since you are not transmitting.

Considering that you live in UK, it is not a bad price at all. The Pro-43 sells here for $299 when it is on sale, plus sales tax. You could order a Pro-43 for less from some discounters here in the states (probably $250), but by the time you pay shipping, customs, and account for the currency conversion, I don't know if you're getting any bargain.

Heh, I just found a copy of local Radio Shack ad...

Anyhow any comments if the scanners listed above would be good for a novice? Or would there be better deal for price in other models...

I'd prefer a handheld, but looking at the Pro-43 which costs 349CDN compared to the Pro-233 which is only 140CDN... Though I guess they have diffrent features...

Also what kind of range should I expect with these things?

I don't agree. Try the following...

FUNC (M.R)
AUDIO ON or OFF (I think ON is better for this example)
LEVEL 7
ENTER
Squelch control to minimum
Start scanning (with the SCAN button)

Pressing MONI will do nothing except display the 'S' on the display until a signal is received which is strong enough to stop the scan. Pressing the FUNC button will stop the scan but squelch will again not be broken. After it does actually stop scanning (when a strong enough signal has been received) you will then (and only then) hear the unsquelched noise AFTER the transmission has finished.

When I originally noticed this problem, it had stopped on a strong signal but there was no audio. I was adjusting the volume and of course heard nothing until the carrier stopped ... then I really got blasted with the unsquelched background noise.

Definitely a potentally dangerous and possibly damaging scenario for the ears!

I think this can only happen if the LEVEL setting is anything but OFF.

Nope. It comes from the morse "K" sent at the end of a CW transmission.
It means "I'm done sending, you can go ahead and send now." Apparently it
was picked up by the emergency services, and now a lot of them use "K"
like a comma in their transmissions....

My $.02 worth, and worth every penny!

From: maverick@csulb.edu
Message-ID: <3ckq97$22r@garuda.csulb.edu>
Source record: 264396

I'm trying to choose between the Pro 43 and the Pro 2006. I know that one is portable and the other is a base station. I really like the Pro 43 but I heard that you cannot connect an outdoor antenna to it with good results, because the signal will "overload and blow through the front end of the Pro 43," whatever that means. I take it to mean that the 2006 electronics are better and can handle a strong signal but the Pro 43 cannot? I don't need the tape output on the 2006. Apart from this, is there a big difference in the quality of the electronics between the two?

Does anyone have any experience with this problem? Email me directly if you'd like. Thank you.

You'll have trouble buying descramblers because of ECPA.

For casual monitoring of simple frequency-inversion scrambling, get a
scanner that can demodulate SSB (like the Yupiteru MVT-7100, AOR AR-8000,
AOR AR1500, Camnis HSC-050/Trident TR-2400, etc). Tune slightly off
frequency in whatever sideband mode the scanner is capable of, and you'll
be able to hear slear speech (with heterodyne) via slope detection.

Air Traffic Control and other conventional aeronautical traffic can be found between 118 and 136 MHz. Most scanners likely omit it since the service is AM. Most FM scanners can pick it up but the audio is real low.

108 to 118 is aeronautical navigation (radiolocation). The only things operating here are VORs (Very-high-frequency Omnidirectional Radiorange) and runway localizers.

You forgot one *important item*

The ones in the US most likely can not be modified for cellular reception,
those in the UK either come that way or are easily changed. Therefore, taking
this new look at it, the ones in the UK are a *BARGAIN* for uncensored units.
The North American versions are holy junk with two holes in the 800 mhz area.
I will no longer purchase scanners with 800 mhz in the US for that reason.
Also since I find 800 mhz very needed in this modern world, that means the
US scanner market lost its ability to sell to me as a result of the stupid
governmental restrictions (ok to buy from overseas, just not for marketing or
manufacture in the US). Nice improvement on the US economy boneheads.

6798. WARNING: John Kwiatkowski RIP OFF!!

Newsgroup: rec.radio.scanner
Date: 1994-12-13 20:46:19 UTC
From: tumeke@midland.co.nz
Message-ID: <3cl16s$jpa@news.midland.co.nz>
Source record: 264405

About 6 months ago I purchased a scanner from this prick, and he did a runner with the money saying that the scanner was on its way, (I am in New Zealand), He had also ripped a few other people off.
Now I have got hold of this person in another newsgroup: alt.2600
He now assumes the email address: 0007152212@mcimail.com (John Kwiatkowski)
He did have the email address : jkwiatkowski@attmail.com
People were so kind as to give me information about this person, but nothing could be done from me being so far away, could some people be so kind to give as much information about this scam arsewipe....
Thanks in advance....
Who what I could do.

A place called G&G Communications can probably help you. I'll bring the
address from home tomorrow ... Good service - reasonable charges (IMHO)
- and tons of old scanners in stock ...

>does this stand for?

The PD in Montreal does this too. Or used to. Interesting considering
that 99% of comms are en francais.

I presume it comes from telegraph where "K" is used where one would use
"over" on voice. That's kind of weird, though, 'cause I don't ever
remember PD or FD telegraph systems using Morse ... (usually just numbers
tapped out - taptaptap = 3, etc)

Unlawful conversion is a fancy legal term for theft; i.e. the property of
one person is "converted" into the property of another person, at least
until he is caught.

I missed the original post, so by official usenet rules, that makes me
uniquely qualified to comment :-)

The problem, Dave, is that when you post to usenet, you post to the world.
Even to Prodigy. Experience has shown that even limiting your
distribution (allowed by some newsreaders) has little effect.

As to your question, <shrug> haven't been thru your burg in about four
years ... Canadian bands run different from US - try searching 142-144
for VHF PD stuff and 410-420 PD UHF. I would highly recommend a copy of
the Haruteq frequency directory for Ontario. I don't know where you can
get one in your area tho'. Scanner Master Books used to carry them
(1.800.SCAN.701 - I think that's valid from Canada) ...

INMARSAT-A is 25Khz wide FM Analog and is the most common voice mode (for now). If you have the equipment INMARSAT is interceptable. On 1537 Mhz (1.537 Ghz) is the Armed Forces Radio & Television Service. This is how the US Navy ships get live entertainment and news. It also makes am excellent beacon to use to align the antenna (dish or yagi) and tune the receiver.

Right you are, the use of 'K' at the end of transmissions in the metro new york area are from the old days of morse code.
The K is the procedural sign meaning my transmission is over.
I have heard this in Conn as well.
Percy Maxim (founder of the amateur radio relay league) was born in grenwich ct. There is a nice stone.
Also the Conn state police were the first in the country to have 2 way radios in their cars. and may have very well asked for ham inputs in the operating procedures.

6815. VHF-Lo 42MHz CHP Reception

Newsgroup: rec.radio.scanner
Date: 1994-12-14 02:30:27 UTC
From: "P. Randy Duran" <rduran@us.oracle.com>
Message-ID: <3cllc3$g6e@dcsun4.us.oracle.com>
Source record: 264177

Hi. I bought a PRO-51 last week with a 8A4 Date Code.
FYI, the Cel Mod doesn't work. Can someone tell me the
date code ranges that are modifiable?

Now the real issue: I'd like to monitor CHP traffic
in my area (San Francisco Bay Area). This corresponds
to the CHP's GAT Division and GG (Golden Gate) Dispatch
Center. I programmed the appropriate 42.XXXX MHz
frequencies (plus 156.7, 154.9050 and a few others) but I
RARELY hear radio traffic, and when I do, it's very faint.
Also, I rarely hear the actual officers; I usually just
hear dispatch. I bought a 25-Whatever MHz antenna from
Radio Shack (the mobile telescoping one) but it only helps
slightly. I receive other frequencies (like 108MHz to the
PRO-51's limit) just fine. What's wrong? I get poor
reception at home and in my car.

Am I listening to the wrong frequencies? Is this an
"antenna thing?" Are there other frequencies I can use to
hear CHP officer & dispatch communications, like repeaters?
Do I need a special antenna for VHF-Lo? Am I simply out of
luck? Any suggestions would be helpful -- I'm only three
weeks into this (scanning) hobby.

Thanks,
Randy Duran

There are NO laws regarding scanning in Canada (other than one or two provinces banning mobile use of scanners). Anything is fair game here.

Since most scanners sold in North America are sold in the U.S. , scanner manufacturers make their equipment comply with the U.S. regulations (sine that is their biggest market). So, it is very difficult to buy scanners here in Canada that have no blocked frequencies. But, it is not very difficult to find companies that will do the modifications to a scanner (if possible), you just have to know which ones are modifyable.

WHY is it that nobody can believe that scanners can receive cellular
(and mid VHF) by using the keypad to start a test mode that will then
allow you to tune those freqs..

Oh well.. :) I've had someone cuss me for suggesting such silly notions. :)

I beleive the PRO-43 was 2 9 LO? Not sure... I have a PRO-51..

Which works on it.. Actually, BAND 2 9, wait, 2 9 LO, then it's set.

The Realistic Pro-51, sold by Radio Shack, is easily modifiable by a keyboard routine. Local stores are still selling modifiable units -- I know because I checked this weekend :-). For Canadian readers, this unit is on sale for CDN $349. I have no affiliation with Radio Shack.

There's a good chance the radio is only a one-way link between the remote
and the studio, in which case you'll notice the carrier is always on
instead of switching back and forth between transmit and receive. The
studio operator would be talking back to the remote location over a plain
old phone line.

I had a similar thing happen to me trying to buy some computer equipment. The guy did get arrested by his local police. Since US mail is involved, federal charges can be brought (mail fraud). I got my money back. Remember that if you have a good bank, and wrote a personal check, you can do a stop-payment and get your money back *even AFTER the check is cashed*. Just tell them what happened and they should be able to help.

you would like to hold on. To start scanning again press SCAN. This was
actually in the manual."

I checked it out while working. The enter key is the 'hold' button when in the search or scan modes. If the enter key is pressed when the radio is not on an active frequency there is a low bloop tone.

The radio puts the frequency into the single VFO mode. Question do you know how to get it passed from the single VFO into the 2VFO mode?

Answer .... Press Function 2VFO not 2VFO.

The old search and hold function of the AR1000 is also implemented if you in expert mode set scan delay down pass none to hold.

Question is there any way to manually control an automatic search? ie
turn the VFO knob as it searchs one step at a time in your limited range?

They aren't standardized. Many depts use "10 codes" and "signals"
and similar brevity codes, but they don't all use the same ones
and they don't all use the same meaning for the same code.

Check "Monitoring America" or "Police Call" or one of the other
similar publications that covers the geographical area that
interests you.

>

Mike in theory this should work. Have you tried it yourself? While
traveling in my work I tried this on police nbfm vhf yesterday
and it didn't work for me using the AR8000. Part of the problem
was fumbling around with it trying to remember what I had to do to
make all the changes needed. (step mode etc)

The 2VFO mode seems to be best for this after you spot the frequency
while scanning or searching. Sequence of key presses

while hearing sigan; press Enter radio goes to single vfo mode
with the target freq.

press function 2vof target is transfered into 2 vfo mode

press function 2vfo again target is copied to other vfo in 2vfo mode

press function mode and select usb

press function step and select ??
I chose 1 khz step but I wonder if a smaller step say 100 hz
might be better?

press 2vfo to switch to the copy of the frequencyu that is
in the normal NFM modeand wait until they go scrambled

hit 2vfo to try to unscramble the traffic when scrambled.

Does this work for any one else?

Vic

Note AR8000 single vfo mode is completely different
from 2vfo mode. Single vfo mode is a very temporary
mode and frequency is lost when changing modes,
2vof mode retains last used frquencies until specifically
changed.

Wrong. The BC350A is not a replacement for the 700. Rather the 700 is a 350
which includes 800mhz. Both radios have been on the market on the while and I
have owned both.

I dont think it would be possible since the transmit and receive frequencies
are separated by 45 Mhz. You would have to get the phone to transmit 45MHz
higher. This would probably require realignment of the RF section.

Now, if you were just trying to transmit on the same frequency as they other
guy to jam his call, then it would probably be possible, providing you have
enough output power.

Not very interesting, Duncan, it's all aero-navigational stuff:-
TACAN, DME (Ident only), ILS (Localiser), VOR. The only voice is
the occasional ATIS superimposed on a VOR, but these are usually
duplicated above 118 somewhere.

Happy hunting

Julian.

>1. Why do Police and Emergency Care dispatchers often sign their transmissions
>with the time. Are they time stamping a recording? Is it just custom?

Although I'm not sure for all areas, but it is probably for the reports & logs they fill out to track their time. Most agencies will digital time stamp the recordings of the voice comms. An interesting side note is you will hear some officers give mileage readings on their cars before they transport people. This is a safety precaution in case someone says the cop took them to some side road and beat them up. The odometer will prove they only went from point A to point B.

>2. I live within 5 miles of a medium sized airport but between 118 and 136 AM
>I only hear the occasional one sided conversation from aircraft... where is the
>tower?

The planes are way up high, so you can hear them for miles. The tower is on the ground so it is harder to hear.

>3. I've only hear one transmission in my area that was strong but not
readable
>(Ok, so there have been a lot but I think something is UP with this
one!) and
>am not sure if it was SSB or Speech Inversion. Anyone brave enough

>the two in text? BTW, this was in ~154~ MHZ Local Govt. Band.

Some local agencies do use speech inversion to try to make comms more secure. There are kits available to decode these transmissions, but the law says you are not supposed to.

...
>Hello, no problems with my ic-r100, works great. Your scanner
>must have been in a bad batch. Good luck,

I don't own an Icom R-100, but here are some possibilities:

1) A strong signal in your Dad's neighborhood is interfering
on some frequencies, fooling the window detector ckt.

2) A reference oscillator in the R-100 has aged and
has drifted off frequency, common in the R-7000 receiver and
Icom IC-275 2m transceiver

Some scanners employ a "window detector" circuit connected to
the discriminator. It allows the scanner to tell if it is
tuned near enough to the center frequency of a signal to pause a
search operation. If the signal is outside of the window, which
implies the scanner is tuned off to the side of the signal, the scanner
keeps searching.

Early Electra/Bearcat programmable scanners (e.g., BC-250)
had window detection but early Regency models (K-500) did not.
Because the Regency models could not tell if they were properly tuned,
they could stop on the wrong frequency (e.g., 5 kHz too low)
during a search.

Source record: 264195

This is a test post of information to see if I have solved the problem of lines running to long with my pc editor in a slip account. I anyone has trouble reading this post please email me as to how much over run on the right side you are still getting.
emailto:vic@ping.com Thanks

Valuable information follows from mil net. Notice warning embeded in text from Fred.

Return-Path: mailto:netzel@iron.afsac.wpafb.af.mil (Fred Netzel)
Fred sent me some very interesting email. Here it is

"...depending upon the location the Military will use different portions of their military spectrum. However in an effort to standardize (for joint operations) the DOD is switching over to a trunked 400mhz system at all military installations. It will be an "easy" trunked type system with the control channel cahnging daily between only 2 channels and the conversation will be on from 10 channels to 20 channels depending upon the size and population of the installlation. Once a month they will perform an emergency test (that lasts for about 2 minutes) wherein they activate ALL frequencies at the same time an transmit a notice that this is an emergency test of the base communications. This is when you set your BC890,8500, 2500 sets into Auto-Store from 406-420mhz and lock in all the base freqs. It will require 2 scans one in 12.5khz spacing and one at 5khz because the government is authorized any freq in this range. And finally once you have the frequencies listed for the base don't put the name of the base on the list, under government regulations putting the two together constitute a "confidential" document that you can be prosecuted for in federal court, assuming the military has the time and motivation to do so. Thats why the FCC listings don't include government/military frequencies. Incidently each government installation that desires to use radio communications must file the appropriate form with their base communciations office which in turn submits it to the FCC for approval, even for calssified projects, so the FCC knows where its coming from when they get the complaints.
enjoy

Fred"

Does that mean then you should not put a military alpha tag on frequencies stored in a radio like the AR8000? I get the feeling that it does. Comments?

JE>> I just got a pro2006 with no manual. Out of trial-and-error I
JE>> have discovered that it must have 10 search banks where you can
JE>> store an upper & lower freq in each one, but I'm not sure how to
JE>> go about doing this.
Attention Jerry DALLAL

Keystrokes as follows:
PROGRAM
LIMIT
search bank number (0 thru 9)
LIMIT
lower search limit frequency
ENTER
LIMIT
upper search limit frequency
ENTER

Also- it kind of looks like you can assign
JE>> the 'priority' channel to any of the 400 channels- again, I don't
JE>> know how to do this
PROGRM
channel number 1 thru 400
PRI

. Lastly- can someone tell me what the
JE>> monitor,

Monitor is used when scanning between two freqs as I told you how to do
above, when you find something interesting and you want to stay on that
freq, you hit the MONITOR button.This stores the freq in one of ten
monitor memory channels

direct,

The Direct /button is for when you are in manual mode , listening on a channel and you wish to scan above or below that frequency, without having to enter a new freq or limit. just hit direct, and you can use the arrow keys to determine what direction you will scan.

and reset buttons are for?
To go back to the proper stepping and mode in reference to the band plan. For some reason you may wish to scan the 144 -148 band in 12.5 kc steps. or in AM. after you have finished, hit the reset button to bring the scanner back to nfm AND 5 KC STEPS

Somewhat confusing article follows:

>Return-Path: mailto:netzel@iron.afsac.wpafb.af.mil (Fred Netzel)
>
>... the DOD is switching over to a trunked 400mhz system at all
> military installations...from 406-420mhz ...

>finally once you have the frequencies listed for the base don't put
>the name of the base on the list, under government regulations
>putting the two together constitute a "confidential" document that
>you can be prosecuted for in federal court...

The IRAC database itself is classified. Despite that, please
cite a legal reference stipulating that a lay person creates
a "confidential document" by writing down a list of the freqs
on which he/she logged activity while located near a government
installation, and furthermore can be convicted for disclosing
this list.

>Thats why the FCC listings don't
>include government/military frequencies.

The FCC does not administer military radio operations on those
frequencies. The FCC regulates civilian, not federal radio
systems (See rec.radio.scanner FAQ articles).

>.... Incidently each government
>installation that desires to use radio communications must file the
>appropriate form with their base communciations office which in turn
>submits it to the FCC for approval, even for calssified projects, so
>the FCC knows where its coming from when they get the complaints.
>enjoy
>
>Fred"

The FCC and IRAC have cooperated in the past to resolve interference
problems, but that's a far cry from the FCC "approving" military
frequency assignments in the 406-420 MHz range. Recall there are
USSS, DEA, FBI, USPS, IRS, and many other federal radio systems
operating in the 406-420 MHz range.

Before the flamethrowers ignite let me say that I know there is a shortwave listeners newsgroup but I'm posting here cuz there are alot of users of this group that really know their stuff around radios of all sorts.

I have a Pro-2006 with a discone 20 feet up on the roof, I also have a Pro-51 that goes everywhere with me. I've been monitoring for quite a few years but have never since being a kid (some 25 years ago) done any shortwave listening. I've been interested but just never got around to investing in a SW receiver.

I just got a flyer in the mail today from the local Radio Shack Outlet (that's a store that sells off all of the discontinued stuff). One of the Items listed is a DX380 Shortwave Radio for $99.97 (list $179.95). My question to all you ghurus out there is this something I'd be interested in getting? Is the radio pretty good or a dog? Any and all input is welcome and encouraged. Please reply soon as the sale ends this weekend :)
Thanks in advance
Dusty

: modifiable, for now.

: Andy

The BC700A is modifiable. I have not seen a BC700A that can not be
modified. The unit was replaced by the BC350A, which is not modifiable.

OK! So it's modifiable. How about some details? I'm told that
Best Buy has the BC700A on sale, but only through the weekend!
Somewhere around $150. Do we bite? Please reply ASAP!
Post and email please if you know where to get the mods.
For once I *CAN* ftp! (new job, new account).

Winsel Oneal Black says:

" I'm sorry I can't help with any battery mod, however, I just
" purchased a BC2500XLT and I am interested in cellular restoration
" Could you please post that mod.

The diagram and the mod is described in detail in the Sept. 93 issue of Monitoring Times, pg 94. I'd suggest NOT performing the mod without having the drawing in front of you. The surface mount components are REALLY close together and you need to move a chip resistor from one set of pads to an adjacent set. You'll definately need to do the work under a magnifier!

Also keep in mind that the newer versions may not (probably aren't) restorable with the same mod.

>Can anyone tell me how long each leg of a dipole cut to recieve cordless
>telephone frequencies (49MHz) should be. Should the dipole be mounted
>vertically or horizontically, or does it make any difference?

Roughly 5 feet on each leg, making a total of 10 feet. Vertically mounted
is the way to go but it won't make THAT much difference. Here is something
I compiled a while back that may be of interest to you.....

An easy way to improve your 30-50 scanning experience is to make a 10
foot dipole (468/frequency in MHz = length in feet, so 468/46.8MHz
which is in the cordless phone base band, equals 10 feet) out of Radio
Shack speaker wire (24 feet of #42-2478 on page 23 of the 1994
catalog). Also, get a RCA to BNC adapter. Take one end of the wire
and cut off the BNC, leaving a few inches of wire on it (you'll use it
later). Take the 23 feet or so of wire and seperate the cut ends about
five feet apart so that it stretches ten feet end to end. Mount this
dipole on the wall, ceiling, or somewhere up off the ground. You may
find slightly more signal strength if you mount it vertically. The
rest of the length is so you have plenty of wire to run from the
antenna to your scanner. Of course, if you need a longer wire run, use
the 50 foot wire. Since 30-50 is a pretty low frequency, cable losses
are minimum. You'll be amazed at the improvement in low band
performance from this inexpensive antenna. Now, for that other BNC end
piece you cut off, seperate the wires until you have about three inches
of wire on each side. Use an ohm meter to determine which wire is the
center lead. Completely cut off the ground wire and leave two or three
inches of the center conductor wire. Get another RCA to BNC adapter
and you have an average antenna for cellular and more importantly, a
good antenna for very strong signal situations where a regular antenna
gives you overload. Since this short antenna is almost worse than a
rubber duck, it is ideal for use at concerts, finding wireless mikes,
etc. without picking up other interference.

From: moy@xp.psych.nyu.edu
Message-ID: <9412141925.AA11284@xp.psych.nyu.edu>
Source record: 264204

: Marc Richard Wollemborg <mrw13@columbia.edu> asks,
]
]On many of the emergency services frequencies in my area, I've often
]heard the dispatcher and the various units call each other "K". What
]does this stand for?
]
]-Marc Wollemborg
] <mrw13@columbia.edu>

I think the use of "K" must have originally derived from its use in radiotelegraphy.

In Morse, the convention of acknowledging reception of a message is by beginning one's transmission with "r," for "received." The end of a transmission is "k," which means "over" or "go ahead."

In International Morse Code, the character "k" is DAH-dit-DAH. In contrast, the character "r" is dit-DAH-dit, or the opposite of "r," so to speak. Brevity is common in Morse communication!

There are also the special Morse characters "KN" which means "a specific station only, go ahead" and "SK," which means "over and out."

Does anyone know any of the technical details for the new Seiko MessageWatch? This new watch also acts as a pager which can display short text messages or phone numbers, notify you of voice mail waiting, receive and display weather info, stock market data, local ski conditions, winning lotty numbers, and sports scores!!!!!

Any idea what frequencies are used regionally to transmit this digital data? modulation schemes?

The watch costs about $100 and the subscription service is about $9.95/month.

The watch and its services has been operational for some time in the Seattle area and is just now being activated in the Los Angeles area.

I'd be interested to hear from folks in Seattle how well the MessageWatch works......it seems like a clever idea....

Wes,

Those are cellular towers. Some cellular sites also house electrically
rotatable direction finding antennas used by some agencies. The array
is usually inside the triangular housing.

I'm hopin to make a discone for wideband reception. Hopefully
from around 1MHz up to 900MHz. I have the following questions:

1) is the "driven" element the "cone" or the flat horizontal "disk"?
1a) which is the ground plane, the disk or cone?

2) any guidelines you can suggest for size of disk and cone?

3) vertical antenna added to the driven element adds gain to what frequency
range?
3a) is the vertical whip added because of weak gain in a certain freq range?
3b) what size do mfr's typically make the vertical piece?

I realize there is no "prefect" antenna to receive all freqs - just
one that can do a decent job. That's all I'm looking for...

6859. Reprograming the 1000 memories of the AR8000

Newsgroup: rec.radio.scanner
Date: 1994-12-14 21:45:11 UTC
From: Flying Turtle <vhealey@crl.com>
Message-ID: <3cnp17$1nf@nntp.crl.com>
Source record: 264215
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Observations on programing the AR8000
The easiest way to get information into the AR8000 is to use a word processor and edit a raw ascii file that looks like a series of commands to the AR8000 to store information. If it is only a series of MX commands they will be accepted at full speed at 9600 baud.
This works out to programing a bank of 50 in a little less then 4 seconds per bank or 80 seconds to reprogram the whole scan memory of the AR8000. The last command can be MA for a read back memory dump. I use a terminal program Procom Plus 4 Win and just dump the file as a straight or raw ascii upload. It works. To make the ascii file the simplest wordprocessor with neat tricks is EPM found in IBM's OS 2. It features something called advanced marking and the ability to toggle stream editing off. What this means is that you can take a column of text fifty lines long and mark jsut a few characters on each line in a straight down block to copy delete etc. I select the third character in which is the bank Alpha portion of its address and do a global search and replace of the marked section only to get a whole new bank. ie change all the E's to F's in E00 thru E49 for example. I type in or collect the frequenccy information and alpha tags on another sheet and use the bank insert to insert a column of frequencies and a column of alpha tags. I then save the text and send it to the AR8000 which easily recognises all the commands and programs each memory cell. This idea would work with even the simplest computers that support a 232 port.

I orginaly wrote a script that would read each line of a raw data file and build the command to program the AR8000's memory. This also worked but not all computers can run this type script. I am going to continue on my programing project but I first wanted to verify that any type of computer could be used to send programing commands to the ar8000.
You can read the information from the AR8000 using the MA for a scan bank dump and save that to a file. That file can be easily edited by ANY TEXT EDITOR and sent back as a series of programing commands to the scanner. This only works for the simple data bank and search bank programing. Interactive commands that require the AR8000 to calulate something or dump memory take too long to respond to a high speed text file with a new instrucion on each line. That is were everyone is going to have to be more creative.

What this means tho even without any fruther development fo scripts or $200 software packages you have the ability with the AR8000 computer interface to clone your AR8000 to others AND the ability to change all 1000 memoriy channels in 80 seconds when hooked up to any type of computer.

I also notice that when interactively working with the AR8000 and sending it instructions if you add a space after certain comands that use the space as a delimiter, they are immedately executed as if you sent a carriage return.

Having fun with my James Bond radio with the tiny computer built into it.

Okay, great! Thanks everybody for your help. I will call Ramsey now and get a catalogue ASAP.

How can I unscramble Inversion Encryption (like cordless phones use)?

Last night while pondering over this question I thought about using my DX-440 shortwave receiver to do the trick. The DX-440 has a BFO knob on it and I thought if I could somehow get the audio through the DX-440 I could just switch on the BFO and fine tune it and adjust it that way. My only problem is how do I get the audio from the scanner to the DX-440?? I thought of maybe using a small CB radio and broadcast the audio to the DX-440, but that is not very discreet and I don't have a CB... Maybe I could get one of those FM transmitters and hook that up to it (like RS Silent Play)... If anyone has any other suggestions please e-mail me or post here. All responses will be appreciated.

Thanks,

John Thompson

Appears you are seeing towers for cellular phone sites.
I invented RadioMap(TM) to help me identify the towers I see
and I identified a microwave tower in my neighborhood the first
time I ran the RadioMap process last July.

From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

As I have already done for dozens of radio enthusiasts in |
several states, I will locate FCC licensed and selected FAA |
transmitter sites in an area of your choice, and produce a |
custom color map. I call this new innovation RadioMap(TM) |
service. It allows you to identify antenna sites |
(including paging and cellular phone cell sites) and
visualize the transmitter locations in your neighborhood,
near your office, at an airport, and other places of |
interest -- from VLF through microwave. |

This is completely different from the limited maps |
displayed on the Grove Enterprises CDROM. Through a new |
licensing arrangement with a professional mapping company, |
RadioMap shows detailed streets, railroads, rivers, and |
cities. Ham radio stations are not shown as they would |
clutter the RadioMap. RadioMap includes key sheets which
list frequencies, callsigns, and licensee names. In rural
areas, ranges of up to 10 miles are possible, while ranges
of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, |
suitable for framing or laminating, for areas in any of the |
50 states. Send $19.95 for each color RadioMap, your name,

address, and telephone number, along with center location |
(nearest intersection of 2 streets, or latitude & |
longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL |
60543. tel. 708-554-3839 6-10 PM central time.

Unfortunatly the poor soul who started this thread lives
in New Zealand help for him is not likely.
I have sent some of the better stories of folks getting
back at Kwiatkowski to him by e-mail. We can only hope he gets a
bit of satisfaction from that. If you have something to add post it
and I will try and forward. True stories involving jail or fines
would be most welcome. TNX and 73 de Jerry

6868. Some questions on scanner use, Pro-39

Newsgroup: rec.radio.scanner
Date: 1994-12-14 23:07:38 UTC
From: sethp@coolidge.harvard.edu
Message-ID: <3cntrq$gd1@decaxp.harvard.edu>
Source record: 264223

I have a few questions.

1. I recently purchased a Pro-39 w/ date code 12A3. I know there
was a discussion of RS date codes recently, but I missed it.
Could someone please tell me what this date code means and whether
or not the unit is modifiable?
2. Is it possible to reduce the volume (or at least the pitch) of the
"beep" the scanner makes so often?
3. I may be visiting Guatemala in the near future. Does anyone know
if there are any restrictions on scanner use in Guatemala?
4. Where can I get a nice carying case for my scanner? The ones
at RS didn't impress me particularly.

Thanks,

Seth

Some arts & crafts stores sell sheet copper, or copper screening. I personally avoid aluminum foil because it's so hard to get a decent connection to it. Motorola sprays a silver coating on the inside of their handheld cases - I first discovered it on an HT-220 model, as the 150mhz model case had a different part number than the 450mhz case. Then I looked more closely, and the 450mhz case had a model number that was printed in white ink on top of a grey paint on top of a silver paint on the 150mhz case. Maybe your local Motorola shop has some of the coating ? or can order it? Back to the easy way - I shielded a microprocessor unit a year ago by taking a roll of fine-mesh copper screen and cutting it and soldering the edges to make a box. Two layers were required for my situation (with the holes offset to make the effective sizes smaller).

There is no law restricting the use of scanners in Canada. That is to say, you are free to own and use one. However, you are legally prohibited from sharing what you've heard with others, or using any information acquired to exploit (i.e., blackmail) others.

: If they allow for it would that mean I could get one that scans those
: channels here in Canada?

Affirmative.

(If you're in Vancouver, try AMP Power Corp. in the Richmond automall. They currently have a great deal on Bearcat 200xlt scanners factory modified for cellular coverage.)

Hello to all,

I purchased a Uniden Bearcat model BC 200 XLT a few
years ago, and from time to time I pick it up and try
getting some channels. My question is this...is there any
way of increasing my reception with this hand held scanner?
Maybe a different antenna, or an add-on devise to increase
the "pulling power" of this unit. Where could I purchase
such devises?

Also, through the reading of the posts in this group, I
understand that certain 800 MHZ's channels are blocked in
our scanners due to federal regulations concerning cellular
phones. Could someone elaborate on this? How big are these
"blocks" and where in the 800 band are they blocked?

Thanking you in advance!

Glen

Hopefully a few of you who are much more knowledgeable than I about scanners can give me a hand. I recently bought a Pro-43 as a Christmas gift for someone in my family. It's fine for their needs, i.e. basic 800 MHz band coverage, the military 200-400 MHz range, and all the other common freqs., and will probably never have any mods performed to it.

As I'm sure many of you have noticed, I paid quite a few bucks for this scanner (even on sale !), and want to make sure it lasts them a while. I would like to know if there's a commercial company that makes a thin plastic cover that will protect the keypad and scanner body, similar to those which people put over calculator keypads. The ones I'm thinking of are very thin and flexible, and do not interfere with the keypad operation. I suppose it should also have an array of holes over the speaker area to help with the sound transmission.

As this request may not be of general interest to the rest of the group, you're welcome to reply to me via my personal E-Mail.

Thanks in advance for everyone's help.

UNIDEN/BEARCAT 200XLT SCANNER ANTHOLOGY

by Bob Parnass, AJ9S

UNIDEN/BEARCAT 200XLT
SCANNER REVIEW

by Bob Parnass, AJ9S

For a long time now, radio enthusiasts have awaited the
arrival of a decent portable scanner with 800 MHz coverage.
Users had grown accustomed to the good sensitivity and reli-
able performance found in portable models without 800 MHz,
like the Uniden/Bearcat 100XL, the Azden-manufactured
Regency HX1500, and GRE-manufactured Radio Shack PRO-30.
Unfortunately, early 800 MHz models, like the AOR-
manufactured Regency HX2000 and HX2200 were disappointing.

Now, the wait for a good 800 MHz portable is over, because
the Bearcat 200XLT is here and it's a winner.

Physical

The new Uniden/Bearcat 200XLT is manufactured in Taiwan, and
looks identical to the tall, gray 100XLT.1 The case is
entirely plastic, and the battery and charging circuitry is
contained in a slide on pack. The differences between the
200XLT and the 100XLT are in 800 MHz band coverage and
number of channels (200 vs. 100).

The "real" volume and squelch knobs on top have a positive
feel, and there is little play in the squelch control.

The closely spaced keys on the 200XLT keyboard are made of soft rubber, and are well labeled. Marshmallow-like keys, combined with fat fingers, require extra care when entering frequencies. The lack of a "beep" tone to confirm key depressions, and the slight amount of tactile feedback, makes it necessary to watch the display to ensure you pushed the keys far enough.

---

1. See "Uniden/Bearcat 100XLT Scanner Review," by Bob Parnass, AJ9S, in The Radio Enthusiast, March 1988.

Memory Organization

As with the 100XLT, the 200XLT's strong point is the amount and organization of its memory. The 200 memory channels are divided into ten banks.

Memory banks and channels may be selected or locked out. The banks are "hard partitioned," just like Bearcat scanners of old. By this I mean, Bank 1 includes channels 1-20, Bank 2 channels 21-40, etc. Regency used "soft partitioned" banks in their HX1500 and TS2 models, but the peculiar Regency system prevents channels from being locked out during a bank scan. Now that Uniden bought out Regency's consumer line, the soft bank concept may die with the current Regency models.

The large channel banks do have their place, particularly when scanning 800 MHz trunked systems and cordless phones.

Banks aside, having 200 channels means no longer having to settle for 10 or 16 most favored frequencies when away from home. Now you can bring it all with you. My 200XLT banks are programmed with frequencies for different situations:

- Bank 1: 20 of the most important frequencies for local sheriff, fire, ham repeater, plant security, etc. I usually scan this bank unless I'm hunting around for something else.

- Banks 2, 3, 4: Government frequencies by agency.

- Bank 5 contains VHF-lo and VHF-hi low power and itinerant business frequencies. Bank 6 contains similarly allocated UHF frequencies. I scan these banks when I'm at a shopping mall, fair, sporting event, or anywhere else I see walkie-talkies in use.

- Bank 7: Just the frequencies I want to monitor while in the office.

- Bank 8: Police, fire, and emergency services for other communities in this part of the state. There's almost always something happening on these channels, even in the wee hours of the morning, when my county is asleep.

The remaining banks leave 40 channels just for trial-and-error searching!

The 200XLT scans at 15 channels/second, about twice as fast as Radio Shack's top of the line PRO-32 handheld. When the 200XLT is powered on it always comes up scanning with

priority off.

The LCD display panel contains all the usual indicators, and can be back lit for 15 seconds with a green light when the proper button is pressed.

Innovations

Both the 200XLT and 100XLT feature set include new surprises. The first channel of each active bank is a priority channel, making 10 priority channels in all. There are 10 levels of priority. For example, channel 1 priority takes precedence over priority channel 11, which takes precedence over priority channel 21, etc. When the priority is switched on, the 200XLT samples all the unlocked priority channels (in active banks) every 2 seconds.

I program the first channel of each bank with the most important frequency for that bank. The priority sampling does appear to "chop up" signals a little more than on older models that sample only a single priority channel. When the power is turned off, then on again, the priority key must be pressed manually.

Let's see, did I program in that new K-Mart frequency, 154.6 MHz somewhere? Just type 154.6, ENTER when positioned to a channel you don't care about, and the LCD will display "CH 29", for instance, if you already have 154.6 MHz in channel 29.

Stated a different way, if one tries to type a frequency into the 200XLT that has already been programmed in another memory channel, the display will flash the channel number in which the frequency has already been programmed. One can override by depressing ENTER again, and the frequency will be stored in the current channel.

This "query" feature is great - especially in a scanner with so much memory.

There is a single button to search all VHF NOAA weather channels, a feature now commonplace on newer UNIDEN scanners.

Battery Pack

The 200XLT comes with a BP-200 7.2 V Sanyo battery pack which slides onto the bottom of the radio. There is a charging jack, marked 12 VDC, and a red charging LED on the

back of the pack. The pack is not supposed to be opened, but the curious need only remove 2 screws. Inside, are the charging components (regulator circuit), and 6 AA size Sanyo cells wrapped in yellow heat shrunk plastic.

The BP-200 battery pack has a 600 mAH capacity, whereas the BP-205 (supplied with my 100XLT) contained batteries internally marked 550 mAH.

When you buy the 200XLT, the 16 hour wall power supply is furnished, and is marked 12 VDC 500 mA. The wall unit is not a charger - the regulator/charging circuit is actually inside the battery pack and uses the 12 VDC furnished by the wall power supply for charging the NiCds at 60 mA. Since the 200XLT draws about 60 mA while scanning (while fully squelched), the batteries will not be charging if the scanner is on while the power supply is connected. To deposit a net charge into the batteries, the radio must be turned off.

The radio can be used with the wall power supply when the batteries are dead, but unlike older crystal controlled portables, there is no easy way to power the scanner externally, while effectively charging the internal battery. Neither is there a way to fast charge the supplied NiCd pack, and the manual cautions against leaving the supplied power pack plugged in for long periods of time (I assume Uniden means with the scanner OFF).

A PS-001 mobile power cord is available for $4 from UNIDEN, as is a spare antenna.

The owner's guide says to expect "up to 5 hours of dependable use" between charges. Now 5 hours isn't enough for many scanner buffs, but perhaps UNIDEN's idea is to stimulate demand for extra BP-200 slide-on battery packs. My 200XLT was used for about 7 to 8 hours before the battery indicator began to flash, but Dan Doyle reports he gets only 5 hours between charges. It is the audio amplifier stage that draws the most current, so battery life is dependent upon channel activity, and the volume control setting. Using an earphone, which draws less current than a speaker,

can mean longer battery life.

Great Audio

The audio output is rated at 480 milliwatts. As with the 100XLT, the 200XLT audio sounds great! There is plenty of undistorted audio available from the front speaker, making a Radio Shack PRO-30 sound like a whisper.

- 5 -

Inside Construction

The internal construction of the 200XLT is clean, but thoughts of home repair vanish as soon as one opens the 200XLT case. Tiny surface mount components abound. You won't find these parts at Radio Shack, and you wouldn't want to solder them in anyway.

The 2 main circuit boards are surrounded by an internal metal frame, and the IF and 800 MHz front end circuits are on small circuit boards, mounted vertically on the main audio/RF board. The PLL is on another small board.

How Does It Work?

My first 200XLT had a problem. The squelch threshold was different for different bands, and had too much hysteresis, which caused it to skip over VHF signals and stop only on UHF signals. This is probably caused by misalignment, rather than a design flaw, as four friends with 200XLTs had no such problems. Grove Enterprises graciously swapped the defective radio for another brand new 200XLT, and the exchange took about a week using UPS shipping.

The squelch action on the new 200XLT is quite good, much better than on the 760XLT and PRO-2004, both of which have too much hysteresis. UHF sensitivity is excellent, and while I don't often listen to aircraft, the sensitivity in the AM aircraft band appears adequate.

Using an outside antenna, the 200XLT is sometimes bothered by the obnoxious 300 watt paging transmitter nearby, but so was my 800XLT on an indoor whip. Expecting a portable scanner to behave well on an outside antenna may be asking too much.

Most every superheterodyne receiver has birdies, those places on the dial where the receiver "hears itself." The 200XLT owner's guide does not list birdies, but they're there. Many of the birdies are weak, and disappear when the heliflex antenna is replaced with an outdoor antenna.

The first IF is 10.85 MHz, and the second IF is 450 KHz. Images of stations in the UHF range were noted 21.7 MHz higher than their assigned frequencies. The cellular telephone bands are disabled, but strong cellular phone signals are heard 21.7 MHz higher than their assigned frequencies anyway. Some people might consider this an advantage! Besides, there's not much activity above 892 MHz to listen to yet.

- 6 -

The 200XLT hears TV stations where they shouldn't be - in the 850 and 890 MHz bands - thanks to multiple injection into the mixer stage, no doubt.

Scanners sold by Grove Enterprises are supplied with instructions detailing how to restore cellular phone band coverage. The instructions for the 200XLT just involve crushing one resistor, but I haven't tried this.

Both my 200XLTs were a few kHz off frequency in the 800 MHz band. Weak signals were slightly distorted, and using the search feature revealed an asymmetry - I could hear the station +12.5 kHz stronger than -12.5 kHz away from what was supposed to be the center frequency.

Having no schematic, I deduced that the orange non-ceramic trimmer capacitor on the PLL board (the board with the horizontal crystal on top of the IC) determined the PLL reference frequency. I programmed a frequency near 850 MHz on the 200XLT, then adjusted the trimmer capacitor while listening to the local oscillator signal 10.85 MHz lower on my ICOM R-7000. The discriminator meter on the R-7000 makes that radio a great test instrument, but be sure your R-7000 is properly aligned before using it to align other radios!

What You Get

Like the 100XLT, the 200XLT comes with a leather-like case, but it's gray instead of black. The case has openings in all the right places, so one can charge the battery without removing the radio from the case. There is a belt loop sewn on the back, but a user must unfasten his/her belt to thread it through the loop, a big inconvenience. The scanner cannot be left standing up while in the case, because the case bottom is rounded.

There is no belt clip on the 200XLT. To carry the scanner on my belt, I use a yuppie-ish Bianchi, hand-tooled leather case, made for the old Kenwood TR2400. My wife bought the used case at a hamfest for $1.50.

The 200XLT also comes with an AC wall adapter, an earphone, and a helical antenna blessed with a BNC connector.

UNIDEN scanners no longer come with an owner's manual, but with a difficult to use fold out sheet instead. The instructions aren't great, but will tell you most of what you need to know. Of course, you don't get a schematic, but you can order it.2

Summing Up

The UNIDEN 200XLT works well. It scans fast, sounds good, and excels in the amount and organization of its memory channels. The 800 MHz coverage, multiple priority, frequency finding, and slide-on battery pack features make it the "Lincoln Town Car" of portable scanners.

So far, the 200XLT is the best handheld scanner I've ever used. Now I'm waiting for Radio Shack to shrink the PRO-2004, so we can enjoy continuous frequency coverage in a portable scanner!

BATTERY CONSUMPTION OF THE
UNIDEN/BEARCAT 200XLT SCANNER

by Bob Parnass, AJ9S

The Uniden/Bearcat 100XLT and 200XLT scanners are the first portable scanners with enclosed, slide on battery packs. Some 200XLT owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation. Owners expect the battery pack to last longer, at least the 5 hours mentioned in the documentation supplied with the radio.

Much has been written about NiCd battery characteristics and charging in general. This article will not rehash general NiCd charging techniques. Rather, we will analyze the current consumption of the Uniden/Bearcat 200XLT scanner, and make recommendations specific to that radio.

BP-200 Battery Pack

The BP-200 battery case contains six Sanyo 600 mAh NiCd cells soldered in series configuration and wrapped in heat shrunk plastic. This pack furnishes 7.2 VDC to the radio. A charging regulator circuit and a light emitting diode are also contained within the battery case.

---

2. UNIDEN, Parts Department, P.O. Box 50822, Indianapolis, IN 46250.

In contrast to the Yaesu FT-23R 2 meter walkie-talkie, which is supplied with a wall-mounted charger, the 200XLT wall-mount unit is actually a 12 VDC power supply. Since the BP-200 regulator circuitry is contained within the battery case, 200XLT owners cannot easily opt for rapid or trickle chargers.

Measurements and Their Implications

The 200XLT's current drain was measured under several conditions, and a graph appears later in this paper. Tests show that the 200XLT consumes more current on higher bands than it does on lower bands. For instance, listening on the 870 MHz band takes 13 mA more current compared with the vhf-lo band.

Measurements indicate that 200XLT current consumption is independent of scanning, searching, or manual modes, provided the scanning or searching is within the same band. This implies:

o If you must monitor 870 MHz frequencies for a prolonged period, it is more "battery-wise" to scan a mixture of 870 MHz and low band channels.

Several factors can contribute to "shortened" battery life. Shortened recharge intervals will be needed if using the radio with the volume control at a loud setting. In portable receivers, the audio amplifier stage generally consumes more current than any other stage. The 200XLT has a more powerful, cleaner audio output stage than do other portable scanners.

The factory supplied earphone is inconvenient and uncomfortable, but test results prove:

o Using the earphone decreases current consumption.

Using an earphone saves about 14 mA indoors, and about 50 mA in noisy situations where one might have the volume control set at maximum.

When using an earphone with the test radio, the best volume control setting was at the 10 o'clock position, versus 12 o'clock when using the internal speaker.

Listening to "busy" channels generally consumes more current than listening to infrequently used channels. One surprising exception, borne out by test results, is that:

o When using an earphone (at 10 o'clock volume setting), listening to busy channels actually consumes less current than when the 200XLT is fully squelched!

Improper battery charging can require the battery be charged more often than normal. If the battery indicator on the 200XLT's panel flashes, charge the battery pack for a full 16 hours. Test results showed:

o The low battery indicator flashes when battery voltage falls to 7.2 volts or less.

The 200 memory channels in the 200XLT are backed up by a capacitor kept charged by the NiCd battery pack. Current is required to retain the memory information, even when the radio is turned off.

How much battery drain is due to maintaining the memory information? To answer this question, the author measured the current required to backup the memory in the 200XLT. A Fluke 8024B digital multimeter indicated that:

o The 200XLT draws about 0.50 mA with the power switched off.

The six cell Sanyo NiCd pack is rated for 600 mAh capacity. If the batteries were perfect, and had infinite shelf life, the memory backup would drain a fully charged battery flat in 50 days:

600 mAh / 0.50 mA = 1200 hours
= 50 days

But no NiCd battery is perfect -- all have a finite shelf life. NiCd batteries will discharge by themselves, through spontaneous chemical decomposition, even when not connected to a load. The General Electric Company indicates that the average NiCd will lose about 1% of its capacity per day at 70 degrees F.

The author developed a discrete time computer simulation which shows that:

o The cumulative effects of self discharge, combined with 0.50 mA drain due to memory backup, will deplete a fully charged 200XLT battery pack in about 40 days.

A plot of the predicted daily decrease in battery capacity appears elsewhere in this article. The plot indicates that:

o To get the most use between recharges, charge your 200XLT right before using it. If you charge your 200XLT battery, but then leave it in a drawer for a week, you will have already lost 20% of the operating time before the next recharge is required.

Average self discharge at 100 degrees is about double (2% per day) the discharge at 70 degrees, which is a good reason to avoid storing NiCd batteries in a warm automobile. At 100 degrees, it only takes about 34 days to deplete the 200XLT battery.

These Recommendations Can Work For You

By using his 200XLT right after charging its battery for 16 hours, Mr. Ron Smithberg reported he is now getting 6-1/2 hours use on a charge instead of the 3-1/2 hours he got previously.

Computer model based on these assumptions:

- 13 -

1. A new battery, fully charged to 600 milliampere-hour capacity at start of day 1.

2. Continuous drain of 0.50 mA to retain 200XLT memory.

3. Ambient temperature 70 degrees F.

- 14 -

BATTERY CONSUMPTION OF THE
UNIDEN/BEARCAT 200XLT SCANNER
Part 2

by Bob Parnass, AJ9S

Some Bearcat 200XLT scanner owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation.

Part one of this article discussed the results of several tests made on the 200XLT portable scanner to determine its current consumption.3 Part 2 will continue the discussion

and present the results of additional tests.

Low Battery Indicator

As presented in Part 1, the 200XLT low battery indicator begins to flash when battery voltage decreases to 7.2 volts or less. This starts a 10 minute timer within the 200XLT. After the low battery indicator has flashed for 10 minutes, the 200XLT display blanks.

o Experimental results show that even after the 200XLT display goes blank, the radio will continue to draw approximately 50 mA.

In the author's opinion, the display blanking feature is a liability, not an asset, of the 200XLT. The owners' guide claims the 10 minute timer and display blanking sequence is designed to alert the user and prevent the batteries from full discharge. But, this assumes the user will notice the display is blank and take action.

Owners have been known to get up to 2 hours more use from the NiCd battery pack after the low battery indicator begins to flash. They turn the radio off, then back on, which resets the 10 minute timer.4 Uniden should just let the low

---

3. See "Battery Consumption of the Uniden/Bearcat 200XLT Scanner," by Bob Parnass, AJ9S, in The Radio Enthusiast, December 1988.

4. Be forewarned that turning the radio off and on rapidly in succession may cause the memory to be lost.5 This may be due to a transient voltage spike. A note in November

battery indicator flash, omit the timer, and let the user decide what to do and when to do it. This would permit the 200XLT to be used longer.

Measuring BP200 Battery Capacity

The BP200 battery pack contains 6 cells and is rated at 600 mAh. Ron Smithberg experienced short battery life in his 200XLT. We measured the capacity of his battery using a procedure similar to the one recommended by General Electric and Motorola. Basically, we timed how long it took to discharge a fully charged battery using a resistor to draw current at its one hour rate. This test considers NiCd cells measuring 1.0 volts or less as "discharged."

1. We charged Ron's battery for 16 hours using the factory supplied wall power supply.

2. We placed a variable power resistor (approximately 12 ohms) across the battery terminals, and kept it adjusted to draw 600 mA from the battery.

3. We monitored the battery voltage during the entire test. When the pack voltage decreased to 6 volts, we noted the time, and stopped the test.

It took only 44 minutes for the 6 cell pack voltage to decrease from over 8 volts to 6 volts. Thus, the battery capacity was only:

600 mA * 44 minutes

= 26,400 mA-minutes

= 440 mA-hours

After performing the capacity test, Ron recharged his battery for 16 hours then used it immediately. He was then able to get more than 9 hours use, much longer than before. Apparently, Ron's battery was suffering the effects of NiCd memory.

1988 Monitoring Times recommended the addition of a 100 uF capacitor soldered across the battery to prevent transients.

- 16 -

Avoiding NiCd Memory Effect

The owners' literature recommends that 200XLT owners run their batteries down periodically to avoid a NiCd "memory" effect.

o Avoiding the effects of NiCd "memory" is perhaps more important for the 200XLT than it is for other portable radios.

Owners who always recharge their battery packs at the first blink of the low battery indicator will not extract the full capacity of their battery. They will decrease its capacity.

Cell reversal can occur if NiCd batteries are permitted to fall below 1.0 volts per cell. There are at least 2 ways to "run" the battery down safely:

1. As described in the cell capacity test above, discharge the fully charged pack into a 12 ohm, 10 watt resistor until the pack voltage is down to 6

volts. This should take an hour or less. You can prop the battery upside down on a piece of wood with with the battery contacts resting on 2 nails. A 12 ohm resistor and voltmeter should be connected across the nails.

After discharging, recharge the battery for 16 hours.

2. Leave the 200XLT scanner on after the low battery indicator flashes and the LCD display blanks. Periodically remove the battery and measure its voltage. When the battery pack voltage reaches 6 volts, recharge the battery for 16 hours. This method will take longer and it is easier for an owner to forget and let the battery voltage dip too low (below 6 volts). This may cause the loss of programmed frequencies, as well as possible NiCd cell reversal.

For Experimentation:
A 200XLT Quick Charger?

Rather than charge the NiCd batteries through the jack on the battery case rear, you could try charging them using the contacts on the top of the pack. This would bypass the internal charging circuitry. As with the discharging scheme described above, you could position the pack upside down on a block of wood with 2 nails touching the contacts. Using a constant current, or pseudo-constant current charger, you could select the desired rate of charge:

charge	duration
60 mA	16 hours
96 mA	10 hours
120 mA	8 hours
240 mA	4 hours

Of course, the battery pack must be removed from the 200XLT while charging this way.

The author uses this flexible scheme for recharging the 7.2 V 600 mAh battery pack on a Yaesu FT-23R walkie-talkie.

Conclusion

The low battery alert feature of the Uniden/Bearcat 200XLT is too conservative, and disables the radio prematurely. Owners can get longer use from their NiCd battery packs if they adopt good charging habits, such as discharging their pack down to 6 volts, and charging for 16 hours just before using the radio.

- 18 -

BATTERY CONSUMPTION OF THE
UNIDEN/BEARCAT 200XLT SCANNER
Part 3

by Bob Parnass, AJ9S

Some Bearcat 200XLT scanner owners don't get the battery life they expect. They report having to recharge the slide on NiCd (Nickel Cadmium) battery pack after as few as only 3-1/2 hours of operation.

Parts one and two of this article discussed the results of several tests made on the 200XLT portable scanner to determine its current consumption.6 This part proposes cures for the overly conservative low battery indicator problem. Modifications should be undertaken only by experienced electronic technicians using the proper tools.

Low Battery Indicator

As presented in Parts 1 and 2, the 200XLT low battery indicator begins to flash when battery voltage decreases to 7.2 volts or less. This starts a 10 minute timer within the 200XLT. After the low battery indicator has flashed for 10 minutes, the 200XLT display blanks, and the radio continues to draw significant current.

The low battery indicator was too conservative in three 200XLTs examined. Owners have been known to get up to 2 hours more use from the NiCd battery pack after the low battery indicator begins to flash.

The 7.2 volt threshold measured in 200XLTs is almost out of range. The 200XLT Service Information Manual specifies the low battery threshold should be 6.9 volts nominal, with an acceptable range of between 6.5 and 7.2 volts.

Zener diode D203, type HZK3CLL01TR, a surface mount component located on the Micom (microcomputer) circuit board, determines the low battery detection threshold.

---

6. See "Battery Consumption of the Uniden/Bearcat 200XLT Scanner," by Bob Parnass, AJ9S, in The Radio Enthusiast, December 1988 and January 1989.

- 19 -

I have not attempted to alter the 200XLT low battery circuit, but it looks like there are a few ways to fix it:

1. The threshold could be reduced if D203 were to be replaced with a zener diode of lower voltage.

2. The low battery circuit could be bypassed completely using one of two methods:

o by removing D203, and connecting the input of regulator IC204 to the output of IC208, a 5 volt regulator, or

o by removing R208, and replacing D203 by a jumper wire.

The only drawback I could see is that defeating the low battery circuit might cause memory loss when the battery voltage becomes too low, because the microcomputer doesn't detect the low voltage soon enough.

Again, the previous suggestions are conjecture, as I have not tried either modification. Readers are cautioned: experimenting with the 200XLT circuitry is risky. The surface mount parts are tiny and and the land patterns on the circuit boards are fragile.

UNIDEN/BEARCAT 200/205XLT
TEST MODE

by Bob Parnass, AJ9S

According to the Uniden/Bearcat 200/205XLT Service Information Manual, the following procedure will load channels 1-25 with various test frequencies, and zero the remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simultaneously and turn the power switch on.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN simultaneously and turn the power switch on.

Some of the frequencies will be out of range, like 108.5 and 66.45 MHz, but will not permit reception.

- 21 -

200XLT MEMORY LASTS FIVE
DAYS WITHOUT BATTERY

by Frank Karls7

Last year I purchased my first hand held, programmable scanner. My choice? A Uniden/Bearcat 200XLT from Grove Enterprises.

A short time later, my brother in law, John, heard for the first time what the scanning world was all about. It didn't

take long and the scanning bug bit -- big time! I lent him my 4 channel, crystal controlled Regency scanner. But every time he saw my 200XLT, his eyes would light up.

A while later, John's birthday was coming up, along with the question was what to get him. My suggestion was a 200XLT (of course). Everyone in the family pitched in and I placed another order with Grove. As usual, the UPS man was at my back door in three days. It was perfect timing because John's birthday party was in two days. I could charge the battery pack and when he opened it he'd be all set.

As I pulled the 200XLT from its the packing, something was missing -- the battery pack! I then called Grove and the extremely understanding lady said they would ship one out immediately. She also said that I was the sixth person with the same complaint. It seems that Grove got a shipment of 25 scanners, all missing battery packs.

When the family celebrated John's birthday, I brought my scanner and battery so he could check out his new play toy. He loaded in a few frequencies and couldn't thank everyone enough! At the end of the party, it was time to take my battery pack and go home and wait for UPS.

That was a Thursday, and the following Tuesday the new battery pack was arrived. After charging, John slid the battery on and fired his baby up. To his amazement, the frequencies he programmed in five days ago where still there! So much for Uniden Corp spec sheets.

---

BC200XLT LOW BATTERY FIXES
Troy T. Pummill, N6XMV

Here are two small articles from MT. I have not tried these mods, do so at your own risk (i.e. your milage may vary).

From Monitoring Times
Bob's Tip of the Month
May 1990, page 98

BC200XLT SHORT BATTERY LIFE SOLVED

Short battery life--sometime only an hour or two between charges--seems to be the only major complaint amoung owners of the laeading hand-held scanner, the Uniden Bearcat BC200XLT. Presumably, owners of similar sets like the BC100XLT BC205XLT, and Cobra 4030 could have the same prob-

lem. Now that is an ailment of the past.

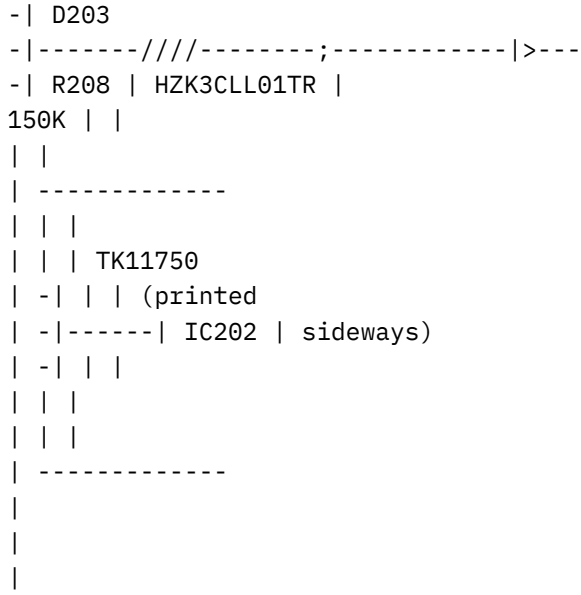
It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor provides the answer.

FREE FIX

MT contacted Uniden and was assured that they will provide the fix for free, even if the radio is outside of the one-year warranty period. If your Uniden BC200XLT suffers from short battery life, send the radioo along with a brief note describing the ailment, to Uniden Customer Service, 9900 West Point Drive, Indianapolis, Indiana, 46250.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.

- 23 -



SHORT CUT

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The radio now operates uninterrupted until it blanks out when the battery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge the original diode with a 6.8K resistor, defeating the premature recharge signal, yet preventing the battery from too low a discharge.

- 24 -

From MT
June 1990, page 98
Bob's Tip of the Month

BC200XLT BATTERY LIFE EXTENSION: Part II

Every time we run a helpful hint on a popular product, someone find an even more helpful hint! This one disable the low battery cutoff circuit and adds several hours of operation to a single charge. Our lab unit was still going strong after seven hours straight! Uniden will provide the fix for free, but if you're in a hurry and don't mind voiding your warranty, read on!

NOTE: This modification should not be attempted by anyone unfamilier with small circuit oard components.

The tools: You will need a small Phillips screwdriver, fine-tip soldering iron and solder wicking braid.

The procedure: Remove the battery pack, then the two screws form the bottom spring clip. Carefully pull the rear cover off, bottom first. Remove tjhe two small screws at the base of the circuit board. Pull the front panel away from the mainframe, bottom first.

At the bottom of the remaining board--to the left of the speaker magnet--are two blue electolytic capacitors; just above them are two striped components-- one resistor and one diode. Using the soldering iron and braid, carefully remove the two components without overheating the board or damaging the copper traces.

When you reassemble the radio, be very carful to note the insertion of the front panel into the slot at the base of the volume/squelch panel. Be especially careful to align the screw holes perfectly, allowing the two rows of fine pin contacts to mate correctly with the socket. If this is not done correctly (and it probably won't be the first time!) no damage will occur, but the scanner display will be blank.

Recharge your batteries after 6-8 hours of heavy use. If the scanner dies, recharge it as soon as possible to prevent loss of your memorized frequencies.

Actually I have a copy of Haruteq but unfortunately the frequency is not listed. I have tried searching 140 all the way to 170 but either the frequency is not in this range or the frequency is so seldom active I never catch it when it is active. I mentioned in the original post that I had the mobiles at 167.19, but I'm sure its not a simplex system since I can't hear the base unit. I will try searching 410-420 next time I get a chance unless someone else has a better suggestion. Once again to clarify: I am looking for the police frequency (base) for University of Guelph police. Guelph is in Ontario, Canada about an hour west of Toronto or 3 hours east of Detroit.

Thanks in advance

Dave

LL-{(2) Is Radio Shack probably the best place to start out for a scanner? I
-{remember looking at a few things in the RS ads but no real searching. Any
-{brands, models that would fit my needs for just general scanning.

What might help you out is to get a Freq List of what is used in
your area and then when you go to buy a scanner you know which
Freq your looking for so you can make a more intelligent choice
on which one you want.
I like the Radio Shack PRO-39 because it's a hand held and has
200 memory channels.

>of the Pro 43,"...

In *general*, the portable scanners aren't able to handle
strong signals as well as base models when connected to an
outdoor antenna. Specifically, that's true of the PRO-43 vs.
the PRO-2006.

Also, base models have more audio output than the portable units.

I have both the PRO-2006 and PRO-43 and think very highly of each.

The PRO-2006 is a better performing, more sophisticated scanner
than the PRO-43. It has better filtering, wider coverage, more
channels, more audio, larger display, etc. No contest -- unless
you *want* a portable, I recommend the PRO-2006 over the PRO-43.

I know that there are a number of active 2 meter repeaters in the St Paul
Twin Cities area. If you have an ARRL repeater directory, you may want to jot
down those repeater freqs. A friend of mine,N2VZV, just moved to St.Paul
about 6 months ago and said it is a very active 2 meter 440MHz area! You may
want
to check with the ARRL about licensing requirements in the US. Have a good one!

:
: I beleive the PRO-43 was 2 9 LO? Not sure... I have a PRO-51..
:
: Which works on it.. Actually, BAND 2 9, wait, 2 9 LO, then it's set.

Big mistake to say "scanners can receive....." Not all scanners are created equal. Very few are the same with different names. All seem to have unique features and very few that I know of have test mode that you can enter through the keypad.

First you have to realize that Radio Slack doesn't manufacture the scanners it sells. I seem to recall that the 43 is made by a different group then the 51. Regardless, the Pro-43 cannot be put in a test mode by keypad combos like the 51. This comes from one who is considered by many as an expert, Bill Cheek.
Maybe people curse you because they wore off the keypad markings and the skin on their finger tips trying to get their Pro-43 to do something you said it would when it can't!

Yes, cellular scanning is legal here. Just don't disclose what you hear.
Cellular capable scanners are still available in Canada at most good
radio shops, though Radio Shack is making the scanners they sell in
Canada non-cell capable. At least that's what Radio Shack said in a
recent ODXA article.

I have this same problem. I can't drive anywhere without noticing every antenna along the way.

One good way to learn your antennas is to get a few catalogs. Antenna Specialists has a big thick catalog that has pictures of all their commercial antennas. You can even tell the beam width of the directional cellular radome-type antennas etc. This will help you Identify most of the antennas out there. Also get a catalog of Ham antennas so you can see where all the hams live, and what bands they operate on.

I use the Austin Condor which is a tuned antenna(s) for VHF, UHF, and 800Mhz,
about 14 inches long. I also use the GRE Super Amplifier especially when
scanning 220-400Mhz, helps pull in distant militart aircraft better. The

> Thanks... Almost made a decision hopefully I'll be getting one of the two
> under the Christmas tree.
>
>

The Pro-43 has triple conversion and makes it very useable in RF dense
areas by eliminating images. The 200XLT is a double conversion unit and is
very prone to images and interference in an RF dense area. Also, the use
of a high gain antenna and/or preamp will only worsen the situation.

Not to start a flame war, but look up U.S.C. 18 * 793:

(a) "Whoever, for the purpose of obtaining information repsecting the national defense with intent or reason to believe that the information is to be used to injure the U.S., or to aid the advantage of any foreign nation, goes upon, flies over, enters, or otherwise obtains information relating to any vessel, aircraft, work of defense, navy yard, navy base, fueling station, fort, battery, dockyard, canal, [add your list of possible military descriptors here], ...shall be fined not more than $10,000 or imprisoned not more than ten years, or both".

Or U.S.C. 18 * 798:

(a) "Whoever knowingly and willfully communicates, furnishes, transmits or otherwise makes available to any unauthorized person, or publishes, or uses in any manner prejudicial to the safety or interest of the United States any classified information-

(1)...

(2)concerning the design, construction, use, maintenance or repair of any device, apparatus or appliance used or prepared or planned for use by the U.S. Govt. for cryptographic or communications intelligence purposes;

(3) concerning communication intelligence activities of the United States or any foreign government;

" ....shall be fined not more than $10,000 or imprisoned not more than ten years, or both".

"...'communications intelligence' means all procedures and methods used in the interception of communications and the obtaining of information from such communications by other than the intended recipients".

While the above statues are open for interpretation in different ways, it would seem to me that these clauses would give Uncle Sam more than enough reason to make your life miserable if they wanted to. If it were up to me, I think I'd play it safe by abiding by Fred's guidance in his post. Or if not to follow his guidance, at least be cautious in handling this info you gain and what you hear on those freqs.

The disk is the driven element, and the cone is the ground plane. Pretty
good reference book for any antenna builder is:

The ARRL Antenna Book
published by the ARRL
cost US$20.00ish (mine is a few years old so price is probably > now)
ISBN: 0-87259-206-5
Library of Congress #: 55-8966

I bought mine at an electronics store. Or you can contact the ARRL at:

American Radio Relay League
225 Main Street
Newington, CT
USA 06111

Has EVERY mathematical formulae you'd every want for building antennas...

Someone once said that misinformation is worse than no information! My
favorite quote is "It is better to keep your mouth shut and be thougt of
a fool, than to open your mouth and remove all doubt."

No, the BC8500XLT is a desktop model. What you meant to say was
BC2500XLT, a fine triple conversion scanner.
I have owned, modded, broken, dropped, fixed,and programmed well over
twenty handheld scanners from Radio Shack, AOR, Trident, and Uniden. The
Uniden happens to be the best of the bunch in programming ease, service
promptness and rugged scanners. I happen to live in the San Fernando
Valley in California (Intermod HELL!) and I have never had any intermod
problems! I think this rumor was started by the Uniden competition to
stifle sales! The one problem I did have was short battery life in which
I called the Toll-Free service number and the unit was fixed in less then
a week and I was given a free spare battery.
What I Like About The BC2500XLT:
1. 400 channels.
2. 100 CPS scan.
3. Nice Backlight.

4. Ease of programming.
5. Leather Case, AC adapter, and Earphone.
6. Autostore.
7. Count feature.
8. Charge circuit built into the battery.
9. Evertime you enter a new freq it searches internally to see if it is already programmed and then tells you what channel it is in.

What I Don't Like About The BC2500XLT:
1. Proprietary battery pack.
2. No alphanumeric display.
3. Not enough people know about this fine scanner.

I am not trying to slam you but please, do not report an opinion as fact!

-Ben

6903. Hints On Scanning In Aircraft

Newsgroup: rec.radio.scanner
Date: 1994-12-15 17:12:38 UTC

Source record: 264061

I have been using my Icom R-1 for monitoring air traffic frequencies for several years. I monitor from within the aircraft when it is permitted. On airlines where their policy is not obvious, I shut the receiver off if asked to do so.

Because the aluminum skin of aircraft blocks VHF radio signals, the only hope of hearing outside transmissions is to be near a hole in the aluminum; near a window. Seats away from the wing are better than those directly over the signal-blocking metal of the wing. However, being next to a window does not guarantee reception of weak signals or signals arriving from a direction the window is not facing. I have found that reception of the ground transmissions is next to impossible in any seat which is not next to a window. Therefore, if I can't get a window seat I don't bother to monitor.

For best reception, I hold the radio's antenna near the center of the window opening. This generally gives the best reception of both aircraft and ground transmissions. I use a pair of walkman type headphones. They allow me to hear the received audio more clearly and block ambient noise inside the aircraft. Using headphones is also less distracting to adjacent passengers. I have been able to monitor both sides of transmissions on long cross country flights and flights outside the U.S. using this method. I have monitored air traffic control transmissions when my plane was over 100 miles from Puerto Rico.

I sometimes listen with a single earphone and an adapter I made. The adapter box plugs into the antenna connector on the receiver, in place of the antenna. The earphone then plugs into the adapter and acts as both an antenna and an earphone. Placing the receiver on the window side of the seat and using the earphone in the ear next to the window alleviates the need to hold the radio and antenna up to the window. The reception is good when the earphone/antenna wire runs up past the window.

In most aircraft there is very little internal electrical noise to interfere with vhf reception. On these aircraft monitoring is relatively noise free. I have found some aircraft however, most notably Airbus with digital flight control systems, generate tremendous amounts of high-frequency electrical noise. This noise fills the aircraft and masks all but the strongest radio transmissions. Sometimes it is not be possible to hear ground control transmissions while still on the ground! On these aircraft I just pack the radio away and hope I brought something to read.

Happy Scanning

This scanner has 2 boards. One will accept the common mod as
distributed around.... the new one will only take the mod as listed in
Monitoring times within the last couple months. The mod for the older
board will fry the new board. Determine which radio you have and I will
try to post the mod to this group or email it to interested people. I do
not know how to get the file to this system to send so it will take time
for me.

BV>Why would a news reporter be allowed to have a scanner and a common
>citizen not be allowed to have one??? News reporters have absoulutely no
>connection to public safety. Can reporters help in a natural disaster,
>NO! And what would prevent me from saying I'm a freelance reporter?

A news reporter doesn't perform emergency assistance, but needs to
know where the "action" is so he/she can report about it to the
general public. Regarding, saying you are a freelance reporter, the
statute defines the qualifications of the news organization and
further requires the employer to submit the reporter's name to a
chief law enforcement official in the county.

From practicing criminal law for 20 years in Marion County, Indiana, I
can tell you this: (1) The fine and costs will total about $200 and
up. (2) You get a criminal record and (3) The last time you will see
your scanner will be in court just before the judge orders it to be
destroyed.

The full Indiana statute is:

Indiana Code I.C. 35-44-3-12 Unlawful use of a police radio;
exemptions; "portable police radio" defined.
(a) A person who knowingly or intentionally possesses a
portable police radio commits unlawful use of a police
radio, a class B misdemeanor.
(b) This section does not apply to:
(1) A governmental entity;
(2) A regularly employed law enforcement officer;
(3) A common carrier of persons for hire whose vehicles are
used in emergency service; (Ambulance)
(4) A public service or utility company whose vehicles are
used in emergency service;
(5) A person who has written permission from the chief
executive officer of a law enforcement agency to
possess a portable police radio;
(6) A person who holds an amateur radio license issued by
the Federal Communications Commission;
(7) A person who uses a portable police radio only in his
dwelling or place of business;
(8) A person:
(A) Who is regularly engaged in news-gathering
activities; AND
(B) Who is employed by a newspaper qualified to
receive legal advertisements under IC 5-3-1, a
wire service, or a licensed commercial or public

radio or television station; AND
(C) Whose name is furnished by his employer to the
chief executive officer of a law enforcement
agency in the county in which the employer's
principal office is located.

(c) "Portable police radio" means a radio receiving set that
is capable of receiving signals transmitted on
frequencies assigned by the federal communications
commission for police emergency purposes and that:
(1) Can be installed, maintained or operated in a
vehicle; or
(2) Can be operated while it is being carried by an
individual.

I recently traded some spare cellular phone equipment for a Bearcat SC150B portable scanner. Never having been exposed to the hobby, I didn't know what to expect. In fact, I'll admit to being less than enthusiastic when initally offerred the trade.

Well, after 4 days, I seem to be hooked! I purchased the new Police Call and Beyond Police call books and have been listining to Police, Fire, Shool busses (strangely interesting episode THERE the other day...), and the occasional cordless phone. I noted some URLs for archives at OAK with scanner info also so I'll be visiting there as well.

If anyone has any advice for a new hobbyist as to organizations, events (in or near Charlotte, NC), and other resources, or tips, or just to say "Hi", I'd love to hear from you. Since much of the info I would need falls into the "FAQ" category feel free to e:mail me (I have a large mailbox <g>). I will answer (or at least acknowledge depending on the volume of responses) all mail. In the meantime, I'll continue to monitor here and scout the archives at OAK and RTFM.

Happy Scanning! -- T.Rob

The CompuServe Forum is called HamNET, and section involved is #2, the scanners section. Note that two of us have done dumps of the AR8000 _EEPROM_, not the AR8000 ROM (significantly different things). I just uploaded here in a message (rec.radio.scanner) a dump and interpretation I did on the Bandplan section of the EEPROM.

6913. Police jargon

Newsgroup: rec.radio.scanner
Date: 1994-12-15 22:04:51 UTC
From: jthompso@nermal.santarosa.edu
Message-ID: <3cqei3$nc@floyd.santarosa.edu>
Source record: 264072

Yea, I wanted to know something about cop talk... I do not quite fully understand the code names for the different officers. When a dispatcher says 6 Frank 3 10-21 Mr. Doe....etc.. What does 6 Frank 3 stand for? I know that Frank is like a day time officer (this probably varies according to location) but what does the 6 and the 3 stand for. The 6 never changes from officer to officer but the other number does. There are 6 Frank 1, 6 Frank 2, 6 Frank 3, etc all the way to about 6 Frank 12.

If anybody knows about this please e-mail me or post here.

Thanks,

John Thompson

I intended to say "most Radio Shack scanners...," but lost that idea of
covering my back.. :)

>have unique features and very few that I know of have test mode that you
>can enter through the keypad.

I have heard that all Uniden scanners (assumably recently produced ones)
contain 'test modes' accessable VIA keypad. And I have heard this is
not true as well.. From what I've seen it is true. That is, before
they took it out very recently to appease the rich congress who doesn't
want us listening to their chats.

>First you have to realize that Radio Slack doesn't manufacture the
>scanners it sells. I seem to recall that the 43 is made by a different
>group then the 51. Regardless, the Pro-43 cannot be put in a test mode by
>keypad combos like the 51. This comes from one who is considered by many
>as an expert, Bill Cheek.

Radio Shack makes very little of what they sell. :) But anyway, most
of their scanners are produced by Uniden, not sure who makes the remainder.
I know the PRO-43's of maybe up to a year ago could be put into this
test mode, I assume they had been that way from the start. IE: The
first ones could do it.

>Maybe people curse you because they wore off the keypad markings and the
>skin on their finger tips trying to get their Pro-43 to do something you
>said it would when it can't!

Herre is what I heard: "All" Uniden scanners could be put into the
test mode by holding L/O 2 and 9 while turning the scanner on. However,
this has been changed. As for the PRO-51, this changed to BAND 2 9, then
holding L/O 2 9 while the LCD test is going on. Who knows, maybe the
PRO-43 has something similar now, changed, but accessable?

As I admitted in e-mail to Bob Parnass, I soon realized I had made
a blanket statement.. It's so drab to qualify everything I say though,
production dates, etc.. But I suppose I could do a bit more when on
a popular subject such as this.. Sorry for the possibly wrong

> Anyone have some times that the Pro-43 lasts during "normal" useage...
Typical NiCad life in a PRO-43 is 6 hours for 600mah batteries. A test using standard R.S. NiCads with: Scan mode, minimum squelch, minimum volume (i.e. receiving, but no audio out) produced a battery warning at 6h 4m and a dead radio 9m later. Maximum audio would reduce this by 1/3; battery saver mode could extend life to 24h on a quiet channel.

> ... might be easier to get new batteries ...
A second to Andy Domonkos' comment. Order a spare battery holder ($3.27) from National Parts, (800) 442-2425, and stock it with alkalines.

The kit referred to by Ramsey is for Voice Inversion Scrambling, if I remember the catalog correctly.

As for using the DX-440, yes a CB would do the trick. RS sells a single channel CB walkie-talkie (ch 14), for pretty cheap. You could also check out your local pawn shops. The FM txer wouldn't do the trick any better than the cordless in the first place, since the cordless uses FM. Unless, the DX-440 can tune that freq, and not the 49 MHz freqs. (I don't know the specs on the DX-440.)

It was imported in Dec 93, according to the way the codes were explained.
Yes, it's able to have cellphone freqs restored by removal of a diode.

However, you could listen to them through their images, in a range that
the scanner currently picks up.

From what Ive heard from my scanner, the "Frank", or Adam or Charlie is
the phonetic word for the first letter of said word. Much like on traffic
stops "Run a plate, Lincoln Sam X-Ray 6 1 9" I know that here in Dallas,
the dispatcher assigns call by beat number. For example if the dispatcher
call for "624" that would be for officer assigned to sector 6, beat 24.
There is also a 4 digit number for officers who are not on routine beat
patrol such as narcotics, vice, and youth division.

Excuse me??? You mean that nifty little extendable antenna on all those
base stations is only used for receiving the mobile? Then why when I push
it back into the base does my reception on the mobile drop to nothingness?
It's a full duplex system, with the base transmitting on the antenna at
46.61-46.97 MHz, and the mobiles transmitting on 49.67-49.99 MHz. The
mobiles transmit with a higher power, and are therefore able to be
received from a longer distance than the mobiles.

6923. Re: UNlisted Freq's?

Newsgroup: rec.radio.scanner
Date: 1994-12-16 00:22:37 UTC
From: Sherrod.Munday@launchpad.unc.edu
Message-ID: <3cqmkd$15lb@bigblue.oit.unc.edu>
Source record: 263986
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I might note that some time ago, a poster mentioned that in at least one case, the PD was using a frequency licensed to an individual police officer. That way, it doesn't show up on the public records as anything that would attract attention, unless you knew the names of all the cops in you area.

(Or maybe I heard this from the local PD...).

You could try my tactic: The "Bold-and-up-front" "Ask-'em" method. You'll usually get stonewalled over the phone, and they'll tell you that they aren't allowed to reveal that "classified" information, but that's usually baloney. Go get yourself a copy of the Freedom of Information Act off one of the ftp servers, and also a copy of the ECPA (we all know what that is, right? :)

The ECPA say's it's legal to monitor police comms (unless it would compromise the officer's safety in certain situations), and the FOIA says you can get government records with the same restrictions. (I'm omitting a _whole_ lot of other stipulations and ramifications, but that's the idea of them.) Check them yourselves before you try to start quoting tehm to the cops or anybody else so you son't sound too stupid if they challenge you (Shall I open my mouth here for my own foot? :)

Anyway, my local PD stonewalled me every time I called to ask about the repeater inputs, etc, secondary channels, etc. Tehn one day, after calling them and getting the usual, "go look in Radio Shcak" bit, I went on down to the station myself and walked up to the front window, asked to speak with someone who deals with the federal licences, and shortly found myslef asking a sargeant if I could "please see your FCC licences, since they are required by the FCC to be "prominantly posted" at the place of business, or available for public inspection."

He got this annoyed look on his face, said wait here (in the lobby), and went into the back, came out with the FCC licences a few minutes later, and spread them out on the benches there for me to peruse. I didn't ask him if he'd mind if I copied down a few of the frequencies: I knew I was already pushing it to see them at all. It helps if you have a photographic memory or can memorize quickly. Since I already knew from Rat shack and other bbs lists most of them, I only had to remember one or two until I said thanks, and walked outside, then promptly programmed them into my scanner.

As I said, they don't exactly like letting them be know to the public, but you might get lucky by pressing it with a little quoting of federal laws and policies on FCC licences. (Your mileage may vary)

Good luck, and I'd like to hear other's experiences on this idea.

>
>I'm looking for a Pro 43 that is modifiable as a Christmas Present. I'm
>looking for one in good condition, with or without cell. mods performed.
>Email with offer.
>pro

Call around all of the Radio Shacks in your area and find a Pro 43 with a date code prior to "2A4" The 4 represents the year ie 199'4' while the leading digit represents the month of manufacture '2' indicating the 2nd month of the year. Another tipoff is that the serial number on the case does not contain an "A" in the serial number. Any Pro 43's built prior to the 2nd month of 1994 can be modified for full cellular.

A local radio shack in my area has one with a date code of "4A3" so I know they are available. I believe the Shack has a sale on them now and are offering them for $299.95

Good luck :-)

6925. Re: Police jargon

Newsgroup: rec.radio.scanner
Date: 1994-12-16 01:17:12 UTC
From: ad225@detroit.freenet.org
Message-ID: <3cqpqo$994@detroit.freenet.org>
Source record: 263984

Police jargon varies from department to department so when requesting clarification it's helpful to mention which department you're asking about.

Here in suburban Detroit, for example, departments passing information to one another over the inner city point-to-point system sometimes don't understand one another. The code for some of the departments for injury accident is a 205-5. Their neighbor uses 10-55. Another uses PI and still another PIA.

My suggestion: get rid of the stupid codes and use plain English!

Is there a mod for the cell-blocked Pro-23 that allows it to receive the cell bands by entering some test mode from some keyboard entries? Please E-mail replies as I don't often read this forum. Thanks in advance.

: are pacific missle range stations. Mission scrubbed about 0745Z. Possibly
: 24 hour re-cycle. May be back tonite (Mon -> Tue) for another try. Heard
: on 6889, 5120, and 5733.

Abnormal is Vandenberg Air Force Base, California. Don't know who Orion
1 or 2 is. What you heard was missile tests with the launch site at
Vandenberg and the destination is Kwajalein Missle Range, Marshall Islands.
This is also known as the Western Test Range. These missile tests have
been going on since the 1950s. Each launch is typically an ICBM, the
missle travels approximately 5000 miles for a duration of 22 minutes.
In the mid 1970s, the military could hit a target at that distance plus
or minus 15 feet. Since each missle had a diameter of destruction of about
100 miles, this is dead nuts shootin in my book. I assume they've improved
a little since then. I know this because I worked on Kwajalein Island from
1975 to 1977.

Correct. Although it is not required to be used, it is part of the NYC radio culture. The fire department is the most common user of K, followed by the NYPD and by people like me on EMS radio. During the summers when I do EMS at a New York State Park, w
e get politely warned every summer not to use K.

Personally, I kind of like it. 10-4 K!

: Radio Shack makes very little of what they sell. :) But anyway, most
: of their scanners are produced by Uniden, not sure who makes the remainder.
: I know the PRO-43's of maybe up to a year ago could be put into this
: test mode, I assume they had been that way from the start. IE: The
: first ones could do it.
:

No, the 43 never could do it. It isn't , wasn't and never has been made
with the ability to go into test mode from the keyboard. My Pro-43 is of
the original cell-mod-able variety. I would love to be wrong on this
issue but as with my rotten luck I am right again!! :-)

: >Maybe people curse you because they wore off the keypad markings and the
: >skin on their finger tips trying to get their Pro-43 to do something you
: >said it would when it can't!
:
: Herre is what I heard: "All" Uniden scanners could be put into the
: test mode by holding L/O 2 and 9 while turning the scanner on. However,
: this has been changed. As for the PRO-51, this changed to BAND 2 9, then
: holding L/O 2 9 while the LCD test is going on. Who knows, maybe the
: PRO-43 has something similar now, changed, but accessable?

Wish it were so but it isn't. I recall somebody posted the Pro-43 is a
GRE radio.

: As I admitted in e-mail to Bob Parnass, I soon realized I had made
: a blanket statement.. It's so drab to qualify everything I say though,
: production dates, etc.. But I suppose I could do a bit more when on
: a popular subject such as this.. Sorry for the possibly wrong

With all the information that passes by on the info highway (sic) it
can be difficult at times to remember whos on first. As I stated above I
wish it were true cause I am too lazy and too poor of vision to dig into
the 43 and liberate cellular. If I didn't already have the ability with
other rigs I probablt would though.

I've got r-s mag mount scanner antenna on my car right now and it seems to work well for just about everything except 800mhz (trunked services). Would adding an r-s mag mount cellular antenna (either the five inch rubber coated one or the larger traditional cell looking one with coil) make an improvement? It says it has a 3db gain. I ultimately would like to connect the two using a bnc T, a bnc to pl 259(?) for the all band, and a tnc to bnc for the cell antenna (and possibly a right angle adaptor so I can manipulate the controls on top of my pro-43).

* Would all these connectors (to a pro 43) produce significant loss?
* Can two antennas - 1 all band and 1 cell be used effectively at once?
* Regardless, which r-s cell antenna would work best the 5-inch rubber covered mag or the traditional looking mag (10 inches approx w/coil), both are advertised at 3db gain.

From: willybg@primenet.com
Message-ID: <willybg.1.009629B5@primenet.com>
Source record: 263999

Hello Everyone I am new to the internet and scanning. I have a uniden, bearcat, portable scanner. It is capable of receiving the band of 806 to 956. The paperwork included with the scanner indicated that it was not capable of recieving cellular calls, however it appears to receive these calls. Is it possible??

Additionally, I have programmed in most of the local police departments; however, the manual indicated that the best use would be to listen to ongoing sporting events. What sort of information could I possibly pick up at a sporting event? I live in AZ and the Phoenix Open is coming in a month, could I use the scanner to pick up some neat and nifty info? If so, how might I go about this?

Thanks a bunch for your help

>Yea, I wanted to know something about cop talk... I do not quite fully
>understand the code names for the different officers. When a dispatcher
>says 6 Frank 3 10-21 Mr. Doe....etc.. What does 6 Frank 3 stand for? I
>know that Frank is like a day time officer (this probably varies according
>to location) but what does the 6 and the 3 stand for. The 6 never changes
>from officer to officer but the other number does. There are 6 Frank 1, 6
>Frank 2, 6 Frank 3, etc all the way to about 6 Frank 12.

If your area is anything like San Jose:
6 Frank 3
6= shift (5-day, 6-swing, 7-graveyard)
Frank= District or main area
3 = beat within the district

10 codes vary from place to place but Monitor America or Police Call are good sources. (ask a local cop for a copy of the codes if you know one)

They also use codes like 459, or 415 which are taken directly from the state Penal code. (459=burglery, 415 disturbing the peace...I think)

You may also find the Fire dept has its own codes also. In San Jose they used 9xx codes for fires.

You may also hear codes like 11-3 which is for drug related calls since the Health an Welfare code book has drug violations under section 113xx.

Hope that gets you started.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to

radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e.,

no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams. |

Plectron and Motorla Alert Monitor Receivers |

In the 1960s and 1970s, thousands of firemen and ambulance | squad members came to rely on their transistor Plectron and | Motorola Alert monitor receivers. They have now been | replaced by portable pagers, and are often available at | hamfests in the $5 - $25 range. Since many are in rough | condition and need repair, a hamfest special is better | suited for hobbyists who like to fix their own radios. |

Plectron and Motorola Alert crystal controlled receivers |
are excellent for dedicated monitoring of local frequencies |
-- a task for which you wouldn't want to tie up your 400 |
channel programmable scanner. These radios are fixed |
channel units and do not scan. They can be powered form |
117VAC or 12VDC with the proper mobile cord. |

The audio quality on a Plectron P1 or 700 series is far |
better than any consumer grade scanner and the sensitivity |
and intermod immunity is outstanding if aligned properly. |
The Plectron 500 series is less desireable. The Motorola |
Alert monitors are pretty good, although the audio lacks |
bass. |

No single Plectron or Motorola Alert monitor can cover the |
entire 30-50 MHz band, and there were versions optimized |
for each portion of the band. There were different "split" |
models to cover segments of VHF-hi band, too. Although UHF |
versions were made, they are somewhat rare. |

Both brands of receiver require special crystals. I |
sometimes use Radio Shack's generic 3rd overtone scanner |
crystals in the Plectrons but they oscillate on frequencies |
far away from their marked frequencies. That's because the |
Plectron oscillator is designed to be used with a crystal |
which oscillates on its fundamental, not overtone, |
frequency. |

If you find the squelch on your Plectron 700 series |
receiver has too much hysteresis, replace R96, a 180K |
resistor, with a 560K resistor. On the P1, the resistor is |
designated R81. |

Parts for Plectron receivers are available from: |

Plectron |
Plectron Place |

Well, naturally, it would be an improvement. However, the scenario you suggest (adding a T-Connector, etc etc) could negate your gain, especially at 800 MHz. I suggest that you look at some of the antennas made for Amateur Radio by Diamond and Comet. The one I know about is a Diamond RH-77A (available at Tucker Electronics or Amateur Electronic Supply, check 800 info for numbers). Call Tucker as I'm sure Comet makes one for mobile use.

I posted this question a couple of weeks ago and go no reponses.
My 200 is DEAD. Won't display anything. Battery light indicates
charging. Even when plugged in, no display, no workee!!
I talked to Uniden this AM and they say I need to spend nearly
$40 on a new battery.
HELP ME!!!

> recent ODXA article.

Shack made this decision solely on the fact they sell CellPhones. They
also threaten their staff with a $4,000 fine if they give out info
on restoring Cell, or by saying who will restore Cell coverage. This
will explain the level of paranoia amongst their salesdroids regarding
scanners. I went into a RS store a while back to check on a Handheld
set. I was plugging in some frequencies when the shack clerk took the
radio away from me and said IT WAS ILLEGAL TO DEMOSTRATE SCANNERS WITH
FREQUENCIES IN THEM! Some of the freqs I plugged in were business band
that I was licenced to operate on, others were the local ATIS plus the
162.400 Mhz Weather frq. Very few (there are some) will do much more
than 'ring-up-the-sale'. I doubt if they could enforce their $4000
fine as it is company policy, Not the law!

Also, keep in mind how the "media" exaggerates... if rags like the Ottawa S***izen got wind of Radio Shack allowing people to enter frequencies into scanners, then the headlines would be: RADIO SHACK INSTRUCTS CELL PHONE SNOOPS! RADIO SHACK HELPS BURGLARS! RADIO SHACK ASSISTS AMBULANCE CHASERS! etc. etc. Oh yeah, also notice how the media calls every scanner user a "ham"? Ha.

>All frequency allocations licensed by the FCC are available in any
>of the current data bases on the market

Basically true, and having access to the FCC database is a great
help.

>(ie; no hidden freq's)
>Andy

Many radio users don't have licenses for the freqs on
which they operate and others don't operate by the rules.
Police agencies are free to conduct low power operations
on other government channels.

How many people buying low power "color dot" walkie talkies
from Sam's Warehouse and Radio Shack obtain licenses?

Also, the licensee name is often obscure, and a simple search
through the FCC database will fail to reveal a license for
the operation you want to scan. This is especially true for
businesses.

Examples are:

"Del Sue, Inc." for The Little Italian restaurant
"Main St. LP" for McDonalds Restaurant
"Maynard L. Silver" for AGE Communications
...

> both are advertised at 3db gain.

Connecting the two antennas in parallel will result in an impedance mismatch to your receiver and a loss in signal strength (>3db). The antennas need to be designed for this purpose. I suggest the use of an active antenna (one with an amplifier at the antenna) such as made by Diamond which provides 20db gain thru 1Ghz. The 12 vdc power is delivered through the coax and blocked by a small gain control unit before it connects to the receiver. Cost is about $160.

]Nope. It comes from the morse "K" sent at the end of a CW transmission.
]It means "I'm done sending, you can go ahead and send now." Apparently it
]was picked up by the emergency services, and now a lot of them use "K"
]like a comma in their transmissions....
^^^^^^^^^^^^Definitely! It's Radio Pig Latin.

I was wondering if anyone else has noticed this kind of language
abuse. I have heard some services using "k" more like a <space> than
a <comma>. Honestly, some transmissions might go something like this:

"10-4 K Be advised K Post 1 K What is your 10-7 K How do you copy?"

Note the missing "k" at the END of the transmission. Arrgh!

6961. Setting a centerloaded antenna for a frequency

Newsgroup: rec.radio.scanner
Date: 1994-12-16 22:30:47 UTC
From: sternk@alumni.cs.colorado.edu
Message-ID: <3ct4en$qdo@csnews.cs.Colorado.EDU>
Source record: 264125

How can I calculate the proper setting of my antenna for a given
frequency?
I have a centerloaded telescoping antenna with 4 parts above
the centerload and 4 parts below it. Obviously, for 40Mhz type stuff
I keep it fully extended and for 900Mhz frequencies I keep it fully
collapsed but I was wondering about the 450Mhz and 120Mhz bands.

The bottom of the centerload to the BNC connector is 21cm
and the top of the centerload to the top of the antenna is 30.5cm.
The plastic center piece itself is 5cm. Not sure if any of this
will help, but...

For Sale

Yupiteru MVT-8000 Base scanner. (UNCENSORED, of course!)

Specifications
==============
Coverage : 100KHz - 1300MHz with reduced sensivity below 8MHz
Modes : AM, NFM & WFM
Increments: 5, 10, 12.5, 25, 50 & 100 KHz
On WFM 50 & 100 KHhz only)
Channels : 200 (In 10 banks of 20)
Search : 10 banks with user definable limits, mode & increment steps
Scan Speed: 15 channels per second (approx)

The unit is in MINT (and I mean MINT!) condition, as it's been stored in my file cabinet at work (and yes, it DOES work). It has approximately 3 hours of usage on it. The unit is noted for is SMALL size and FULL coverage (can you think of another base scanner that will pickup shortwave?)

For those unfamiliar with it's petite size, look in library #2, as I uploaded both a GIF and JPG of the unit last year.

Price: $375 COD
Shipping: I'll ship 48 states ground

If interested, please EMAIL to baranowski@aol.com

Thanks for your time..

I found when I was last on a plane with my scanner, I was flying somewhere over 4-land, and was picking up a VHF repeater with S9, full-quieting. Keep in mind we were about 35-40,000' NSL with no obstructions, and yes it was a window seat...but the point is I kept that one repeater for a good 30 minutes. When I scanned a little bit around that frequency, I picked up 2 more repeaters with the same quality, and 1 with a little less strength. It was quite interesting. =)

Hello Scanner Listener. For christmas, I'll be getting Uniden's BC147XLT-1 16 channel scanning radio. I'm very excited about this. Anyways, I love trucking, and hopefully someday I can have my own company!! Well, I recently received the specs on this scanner and I realized that the freq. coverage started at 29mhz. I was told that Ch. 19 which is used by truckers is 27.185! I won't be able to listen in! I'm no upset, but I'll be missing the fun. Are there any other freqs that I can use to enjoy! I'm really interested in freqs that enables me to listen to J. B. Hunt & Schneider National drivers. Please help me!

Ron

6971. AR8000 good as base station?

Newsgroup: rec.radio.scanner
Date: 1994-12-17 01:01:13 UTC
From: maverick@csulb.edu
Message-ID: <3ctd8p$nq8@garuda.csulb.edu>
Source record: 264133

I was just wondering if the AOR AR8000 would be a suitable scanner as a base station even though it is a portable. In other words, when hooking up an external outdoor antenna such as a discone, would it still have the same intermodulation problems that other portables such as the RS Pro 43 suffer. Or are the AR8000 electronics so superior (selectivity, rejection etc) that it could handle an external antenna with performance equaling or exceeding a dedicated base station such as the 2006?

Email me directly if you'd like. Thanks for the help.

You wouldn't want them both attached at once, it won't work as well as
you would like. When scanning each band, use the antenna which works
better, by itself.

How about hearing some of the other unusual public safety pig Latin that's out there? Like:

"Clear!" at the end of each transmission, by the Michigan State Police.

Or "What's your pleasure?" by the Dearborn Heights, Michigan Fire Department.

It would also be neat to see some postings of unusual radio traffic. Like this one I heard on Southfield, Michigan Police Department's frequency:

"1234 Main Street. A dog making verbal threats at passersby."

Ouch! How about this instead:

"1234 Main Street. A dog barking at the pedestrians."

Another thing that sneaks into police radio jargon in my neck of the woods is:

"The suspect is driving a car that's blue in color."

As opposed to what? Blue in smell? Maybe this would do just fine:

"The suspect is driving a blue car."

Any other contributions?

6981. That NFL Coach/QB System (General Info)

Newsgroup: rec.radio.scanner
Date: 1994-12-17 07:19:05 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <3cu3d9$hlj@umcc.umcc.umich.edu>
Source record: 264142

It seems like every other week, someone is posting the same old question about those new NFL quarterback radio systems -- What frequency do they use?

That's one question I can't give a specific answer to, since I have no interest in watching football.

But I have come across some info about this NFL Coach/Quarterback one-way system that I thought I'd share.

First, the purpose of the one-way system is to allow coaches to (securely) pass a suggested play/instructions to the quarterback, while the QB is out on the field. The system was authorized by the NFL because it will "raise attendence, by curious scanner-wielding geeks anxious to find the C/QB frequency." Well, that'll probably be true, but the real quote is "...to promote more offensive production" (*MY* fake quote makes much more sense to me!). Supposedly, it will also help reduce the legnth of the game, by reducing penalties, which delay the game. This should sound good to everyone who turns on their ABC affiliate at 11:30PM expecting to catch 'Nightline,' & instead sees some idiots running around trying to chase ball, delaying Nightline for about 90 minutes (but of course, football should certainly take precedence over a news program...).

The link from the coach will be cut-off (by an impartial NFL employee) when the QB leaves the huddle & a 'play' starts. It is also cut off when there'sonly 15 seconds left on the "play clock."

The radio system is a proprietary design by the president of Control Dynamics Corporation, Mr. Harvey Shuhart. CDC manufacturers the rugged receivers in the QB helmets. The RF link often utilizes a Motorola GP-300 transceiver, & the coach's headset is a Telex Communications, Inc. design that interfaces the headset with both the GP-300, & the normal wire-based circuits that the coaches use to talk with other team staff, but only the coach can transmit thru the GP-300 to the QB. The GP-300 carried by the coach (or his/her designate) apparently transmits on an input frequency to the cut-off unit controlled by a league official on an upper level, where, unless the NFL official disables it, it is then repeated on another freq. to the quarterback.

The QB helmet consists of a radio receiver module with decryption circuitry, and an audio module with one speaker near each ear. It is apparently powered by a regular 9-volt battery. I imagine the antenna might be impregnated into the resin helmet. Each team will have a total of four of these $20,000 helmets. One for each of the QBS, + a spare.

Unlike with the wire-based team comms systems, there is no policy of the other team having to stop using their C/QB link if their opponent's C/QB system breaks.

Frequencies used for these C/QB systems are apparently in the UHF range, probably somewhere between 450-480MHz, and is 'secure,' used what I assume to be a digital-based crypto scheme, since according to literature, there is over 268,000,000 possible code keys.

Suppliers of the crypto system include Transcrypt (Lincoln, NE), MC Comm (Winston-Salem, NC) & Selectone (Hayward, CA). In particular, the Selectone model ST-25AGP system is used.

****

The above info is taken from an article about the system appearing in the AUG 94 issue of SIGNAL -- the journal of the Armed Forces Communications Electronics Association (AFCEA), and a promotional brochure put out by Selectone Corp.

I suppose if anyone is interested enough, they could call Control Dynamics Corporation (Iveyland, PA) & track down more info.

While the information transmitted over this system is probably 'secure,' I wonder how long it will be before some idiot with a modified 440MHz handheld decides to jam the link, either for the hell of it, or specifically jamming the C/QB link of the visiting team.

Tim

From: bhatlas@pyrite.SOM.CWRU.Edu
Message-ID: <3cu99p$1qt@usenet.INS.CWRU.Edu>
Source record: 264143

I just purchased a BC2500XLT with a date code of OCIC (3/93). I read
the cellular mod for this unit, and am hesitant to perform it myself.
Can you point me to individuals or companies who will perform the mod
for a reasonable fee?

The mod involves unsoldering a chip resistor and moving it one place
to the left.

Thanks in advance.

Sunil.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the | Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, | PRO-2004, and others. Don't despair, the fix is simple for | most radios. I've successfully reduced the squelch | hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as

identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

I don't know if I'd use the words "so superior", but I am very happy with my AR8000 in "base" mode. I bought a cradle from Grove ($10) that keeps it from tipping over. For long-time AC use, remove the batteries to keep from overcharging (per EDCO technician).

The antenna is a Diamond discone; a second antenna is a Windom-design (off-center dipole) around 66' long. I don't see any signal difference between the antennas on shortwave.

I'm in a city of 50,000. There's a low power TV station 2 blocks away, AT&T microwave tower less than a mile away. I don't see any sign of intermod. I sold an ICOM R7000 to buy the AR8000 - I'm not sorry. Selectivity in the shortwave bands is a little weak, but quite acceptable. SSB reception is OK.

The main problem has been the radio's small size - you can't just reach over and hit a button or spin a knob.

Open up the battery pack and check out each cell with a voltmeter. One cell may be bad. How have you been using the radio (on charge for long periods?). Is the battery pack registering any voltage at the contacts?

> capable of
> recieving cellular calls, however it appears to receive these calls.
> Is it possible??

Yep. Even if the actual cellular frequencies are blocked out, Bearcats are mostly dual-conversion receivers. Without getting too technical, this means that Bearcat scanners are prone to receiving signals approximately 21 MHz above the actual frequency of the transmission.

> however, the manual indicated that the best use would be to listen to

so,
how
> might I go about this?

It sounds like you bought one of those Sportcats. They are specially packaged and marketed for sports fans who would not otherwise buy a scanner. As you have discovered, you can still use it to scan the things the rest of us already monitor. Personally, I think the most "nifty info" available at a sporting event is found on the local police, fire and EMS channels.

> >
> > (Or maybe I heard this from the local PD...).

One possibility that happens quite frequently is the use of "local government" frequencies for police and/or fire use. Some small cities may use 1 freq for police, fire, water and road dept. but the usual is when all "Police" frequencies are in use in or near a metro area, the police may apply for and get a "local government" channel and use it for police use. Try any frequencies listed for any type of use by the jurisdiction you want and you may find the police using them..hope this helps..

True Andy, but you may have to try different names ie.
City of Gotham
Gotham Police Dept
Chief Bat E. Man, Gotham City Police
Gotham City Department of communications,
>
For those trying to find frequencies, you may have to look a little
deeper in the freq. guide and try other names for the city, etc and also
look in the other radio services listed and see if the people you want to
hear are using other government freqs.
happy scanning..... Mike.....

6988. ScanStar Commercial Edition

Newsgroup: rec.radio.scanner
Date: 1994-12-17 15:41:56 UTC
From: Keith@elgin.demon.co.uk
Message-ID: <787678916snz@elgin.demon.co.uk>
Source record: 264075

On page 76 of Monitoring Times (December 94) there is an advert for a computerised scanning package called "ScanStar Commercial Edition" with a BBS number to download a demo version of the package. The number is in the CA area 1-408-258-6462 with baud rate between 2400-9600 N81, login as guest.

Has any members of this newsgroup downloaded the demo yet and if so how about emailing a copy to me. International phone calls are a bit expensive in this part of the world, so if any scanner user if the CA area would like to help I would be most grateful.

Thanks in advance.

I would not recommend the ic-r1 for use as a primary scanner to anyone. It does have a nice small size and some nice features but it suffers from extreme intermod, the audio is very poor, and the selectivity is basically non existent. The are other handheld scanners out there that would do a better job. It is ok as a secondary scanner (as I use it).

I hope this helps.

Pro-39 about 1 year old. 200 Channels + 800 band (cellular locked but easily modifyable). It has no manuals, unfortunatly. Its not very hard to use. I will inclue a 25-1296Mhz antenna + a power adaptor and batteries. I am asking $160.00 but will take the best offer. Would like to sell by 1995. If you have ANY questions, contact me at SlikVicMan@AOL. Thanks alot.

Unlawful conversion is a financial term. If you give me a bad check and
receive something of value for instance that is a form of unlawful
conversion. If you bring back goods that you stole and expect me to
give you a cash refund that may possibly be unlawful conversion,
I am not positive though.

6999. AR8000 and CB mobile antenna

Newsgroup: rec.radio.scanner
Date: 1994-12-17 22:22:25 UTC
From: Flying Turtle <vhealey@crl.com>
Message-ID: <3cvob1$2un@nntp.crl.com>
Source record: 264168
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I hooked up the AR8000 to a CB mobile antenna today. Suprise, I
received the Denver Col time checks on 5. 10. and 15. clearly.
The signal on 15. K was extremely strong as the day wore on
as expected. Broadcast SW came in acceptable also while mobile.
I was able to copy the BBC around 9:30AM EST around 9+ K.

I noticed that I had some interfernce from a fan in the heater.
I don't have this on the higher frequencies. CB 27.185 came in
acceptablely but I think a dedicated CB probably would do better
on that frequency. I meant to try putting that in priority
with a check around ever 9 seconds but I forgot to.

This radio can be set to scan acceptably for AM signals
which makes looking thru the SW broadcast bands rather nice.
It scans these better then the Grundig 700 I just sold.

Michael E. Raub (mraub@prairienet.org) writes:
>Can anyone tell me how long each leg of a dipole cut to recieve cordless
>telephone frequencies (49MHz) should be.

Aprox 1.5m (that's close enough if you don't wish to transmit).

Should the dipole be mounted vertically

In most cases yes.

>or horizontically,

Not Normally

>or does it make any difference?

Yes, orientation of the receiving antenna must match that of the
transmitter to maximise signal level.

Merry Solstice :-)
Julian.

12/17/94
Awhile back I posted a request for 216 Mhz coverage in a low end hand held scanner. It was suggested that Grove had a converter that covered that range, however their converter doesn't start until 220. Does anyone know of a handheld, other than your $400+ full coverage models? I'am looking for one to use in animal tracking to pick up signals between 216-217 Mhz, I would be using a directional yagi. Older/discontinued model numbers would also be appreciated if anyone knows of any. Thanks in advance for any input.

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60

5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset

frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

7006. Fast Food Frequencies Nov. 1994

Last Updated: November 1, 1994

Since there has been quite a few posts wanting this data, here is a list of fast food frequencies that is listed in the November issue of Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies to every fast food chain for their own use, and that any fast food restaurant can buy whatever low powered FM transmitters / receivers they need for their store at an electronics shop. Anyway, just stick the below in one of your scanner's channel banks, and see what comes up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

Hardee's 30.84 31.00 35.02
151.685 151.805 464.0125
469.0125

Kentucky Fried Chicken 31.00 170.305 457.5375
457.5875

Taco Bell 30.84 154.57 465.8875

Wendy's 33.16 33.40 154.515

Burger King 30.84 457.55 465.8875
467.775

Spacing is 30 Khz. The tower frequencies are generally in the 869 -
894 Mhz range (the one's one usually listens to on a scanner), and
the handset frequencies are 824 - 849 Mhz. There are about 1,000
frequencies to search in each of those bands, so in searching those
frequencies, you obviously use your scanners search mode, as it
wouldn't make sense to try to program them in your channel banks.
Not many scanners go up to 1,000 channels, so you couldn't program
them all even if you wanted to.

Trident is the brand that ACE Communications started using when they lost
the distribution rights for AOR. They are made in the same factory as many
AOR models (***NOT*** the AR8000) by Nissei Electronics of Japan ...
along with Camnis, Fairmate, etc.

Considering the fines they paid the FCC last year for selling uncertified
scanners, I seriously doubt that.

Ron,

I can't help you much with more freqs for trucker but if you could convience
whom ever is getting you this scanner to get you a Radio Shack 2004, 2005,
or 2006 then you will be able to get the CB freqs.

Radio Shacks Short Wave radios also pick up 27 mhz - CB.

Try a local camera store. A few of the nylon cases will accomodate a scanner.

Also check your local army surplus or police equipment store. They usually carry some handheld holsters.

From: willybg@primenet.com
Message-ID: <willybg.3.00391D34@primenet.com>
Source record: 264091

Hi Guys,

General question. I live in an area where the PD is on 800mhz trunked system. I have read the information in the Police Call book about trunk systems and if what i read is correct, a computer switches transmissions to the next available frequency. This is opposed to each channel having its own frequency. While I have been listening, this appears to be true. Do I correctly have an understanding of the concept????

Next, while listening to the channels owned by the local PD, I heard telephone patches not related to the pd or the local government agencies using these 800mhz channels. Why is that??

Also, It appears that I am receiving cellular calls in the upper 800mhz and 900mhz freq. I thought I was not able to receive cellular calls?? R these really cellular calls? What are the general cellular mhz ranges

Lastly, anyone out there have an opinion on a Radio Shack Portable model 39. It has 200 channels, searcable upper and lower limits and receives 800 and 900 freq? Also is there any way to increase reception while the unit is in the house? Outside antenna? suggestions

Paul,

You really don't need something that exotic. I use a verticle dipole feed at the centerpoint of my dish cut to 1540Mhz. If you have a good LNA a vert dipole will work fine.

7022. Strange 454 MHz signals

Newsgroup: rec.radio.scanner
Date: 1994-12-18 07:26:06 UTC
From: kg5ai@w5ac.tamu.edu
Message-ID: <3d0o6e$2s3@news.tamu.edu>
Source record: 264079

Hearing some strange signals in the 454 MHz band the past few months.
They are NOT aircraft related nor do they seem to be phone/pager related.
Specific freqs here are 454.175, 454.250, 454.300, and 454.575 MHz.
The best way to describe the signals are that they sound like trunking data
channels (but not exactly). The 454.175 one sounds like is is *busy* for
lack of a better term. The other channels just have a buzzing sound.
Haven't researched it enough to determine if the 'busy' channel moves.
Think I found the tower it is transmitting on. City of transmitter would
be listed as Bryan, TX. No voice on this at all. I estimate power on this
to be about 50 watts. Gets out at least 30 miles. Anyone else hear this
stuff or can look it up in a more recent database?

myles KG5AI

7023. Pro-46 touchpad mod

Newsgroup: rec.radio.scanner
Date: 1994-12-18 07:55:46 UTC
From: dbarton@moe.cc.emory.edu
Message-ID: <3d0pu2$j9r@emoryu1.cc.emory.edu>
Source record: 264080

Greetings. Since there have been some requests lately I thought I would repost this spiffy mod for the Pro-46. This will not restore full 800 MHz coverage, but it will restore the hole b/t 868.9375, and 896.1125 with straight 30 kHz steps. All standard disclaimers apply, including but not limited to the following:

It is not legal to listen to other people's telephone conversations with radio and/or scanner equipment. This modification is provided for information purposes only, not as an attempt to encourage people to commit illegal acts. No warranty is offered, or should be implied.

PRO-46 TOUCHPAD MOD

This mod will give you access to several frequencies not in the Pro-46's normal scanning range. It will require you to erase all currently entered frequencies, so I suggest that you write them down on paper *before* you begin this process.

1. Turn off the power.
2. While holding down the 2, 9, and L/Out keys, turn the power back on.

This will erase the currently entered frequencies, and input freq.s into the first 25 memories. Of particular interest are the freq.s in the following memories:

#14: 66.450
#15: 76.825
#16: 87.425
#23: 888.96

Each of these freq.s is outside of the normal scanning range of the unit. #14 and #16 are in the TV range, #15 is in the land mobile range, and #23 is in the cellular range.

To use any of these freq.s, first store them in a monitor memory,* then once you have reprogrammed your scanner you can place them into a regular memory. You can then use the manual scan feature to search through the ranges these frequencies give you access to. You still cannot enter frequencies in these ranges manually, but any freq. stored in a monitor memory can be transferred to a regular memory. Best of luck.

*To place into a monitor memory, open the squelch all the way (so you hear static) and push one of the arrow keys. This will start the manual scan feature, but the frequency should not change because the squelch is open. You can then press the Monitor button to store the freq.

Permission is hereby granted to copy, transmit, archive, or send this file by any medium as long as it is reproduced in its entirety. Many thanks to those who submitted the info originally (sorry I lost the names).

Source record: 264112

i've been listening to chp in the san francisco bay area now for about 2 years. really helps out on my commute in the mornings and afternoons. i've been doing it mobile for the most part. i find that my 9ft cb whip works great for the reception. the problem is, most scanners aren't going to work all that well for receiving the mobile units, just because they don't receive low-band very well to begin with.

i find the traffic to be pretty sporadic as far as when i can hear them some days i can hear them as far as 60 miles away over hills and all, and others i'm lucky to hear a mobile that's more than a mile from me. on the average, though, i find i have decent mobile reception anywhere within a 15-20 mile radius around me. the cruisers are pushing typically 100 watts on their rigs, while the motorcycles are limited to 25 watts. i don't bother with the mobile extender freq (154.905) much since on my commute i often end up going from the 24 office (san jose) to the 25 office (oakland?) daily and the traffic from both overlap. it's really not worth my time to dial it up on my dual-band ham rig and tone squelch it out.

suggestions: about all you can do is make sure your antenna connections and ground plane (a must i find for chp) are good ones. try not to listen to more than one office at a time. san jose chp is 42.5 for the base and 42.28 for the mobiles. remove your delay on the channels, since you'll miss replies with it on. if you're not receiving the base signal/s (at the very least the base for your area) strong and at full quieting or close to it, you're either in a very bad area to begin with or you have something wrong with your antenna setup.

good luck

Shamefully, Uniden will let outlets like Service Merchandise sell
their 200 channel hand held scanners but will NOT allow them to
stock replacement rechargable battery packs.

You're forced to order them from the company at a cost that is
not competitive.

It happened to me and when I called Uniden they said, "sorry
we're out of stock and it'll be a couple weeks to a month before
we're back in supply." Ouch!

A friend of mine who is more technically oriented than I took
a dead battery pack apart and found it to really be just a
series of common rechargableseries of common rechargable batteries that are linked ... the
kind you can buy off the shelf at, say, Radio Shack.

I hope this helps you.

I saw a post somewhere last week that says AOL has a file called EPAGE.ZIP

I dont have access to AOL, and an Archie search did not find it for me.
Maybe some one can get it from AOL and make it available to all fo us?

JT>How can I unscramble Inversion Encryption (like cordless phones use)?

JT>Last night while pondering over this question I thought about using my
JT>DX-440 shortwave receiver to do the trick. The DX-440 has a BFO knob on it
JT>and I thought if I could somehow get the audio through the DX-440 I could
JT>just switch on the BFO and fine tune it and adjust it that way. My only
JT>problem is how do I get the audio from the scanner to the DX-440?? I
JT>thought of maybe using a small CB radio and broadcast the audio to the
JT>DX-440, but that is not very discreet and I don't have a CB... Maybe I
JT>could get one of those FM transmitters and hook that up to it (like RS
JT>Silent Play)... If anyone has any other suggestions please e-mail me or
JT>post here. All responses will be appreciated.

Here's a thought. The 440 has the capability of hooking up a 5 pin (I
think) DIN socket. If you see an old Commodore laying around, the jacks
on the back for the disk drive work just fine. It solders right in, and
you just remove a plastic plug to make room for it.

From the archives:

On the Sangean ATS-803A the DIN jack looks like this (I suppose it looks the
same on the modified DX-440), FACING THE DIN JACK:

```
(b)(a)
R R o o R F
A E \ | A R
D A (c) o--- [ (f) D O
I R / | I N
O o o O T
(d)(e)
```

a = left input (unconnected) d = right output b = right input
(unconnected) e = left output c = ground f =
locating hole

The DIN plug connections, then, must be exactly the same, FACING THE BACK
(WIRE SIDE) OF THE DIN PLUG. Attach the stereo plug, or LEFT and RIGHT mono
plugs, as above. total cost: about $7

One last note on taping from the ATS-803A/DX440: I don't believe this radio
can activate a tape recorder's remote control, but by using the radio timer
in conjunction with a voice activated tape recorder you can achieve the same
effect. I use a Radio Shack Minisette-20, and it works like a charm!

Did you see it? Left and right INPUT! I don't know if ther inputs are
hooked up on the 440, but it would be worth a try....

This is very good advice from Doug. I have found my experiences similar. One difference, however. I ALWAYS ask to speak to the Captain when I board the plane, then show him my receiver and politely request that I be allowed to listen to the radio and follow the flight that way. I stress that it is a receiver only. Only once in ten years have I been refused permission to listen, and I haven't flown that airline since.

Last time I saw, the RESTRICTED equipment list included VHF/UHF
receivers (Restricted equipment can be used at any time except
during taxi, takeoff, initial ascent, inital approach, and landing).
However, the BANNED equipment list included transmitters of any
kind, including Cell phones.

7038. Audio activated switch for tape recorder???

Newsgroup: rec.radio.scanner
Date: 1994-12-18 19:45:54 UTC
From: dhubba@access3.digex.net
Message-ID: <3d23hi$84d@access3.digex.net>
Source record: 264098

I'm looking for a device that will switch on a tape recorder once the squelch is broken on my scanner. The device would accept line level audio (e.g. headphone jack) as the input and provide audio out and a switched relay as the outputs. The audio out would feed the AUX on a tape recorder and the relay line would feed the REMOTE jack.

I've seen similar devices (e.g. voice activated switch and telephone recording devices) but nothing that accepts and passes line level audio.

If anyone knows of an available kit or completed unit, I'd sure appreciate it.

Thanks in advance,

Dave

Why not just buy a VOX recorder. Radio Shack has their $49 unit on
sale for $35 right now. I have a mod for it to shorten up the units
shut off time if you need it.

Radio Shack has its compact VOX recorder on sale again, perfect for
scanner'ers. Below is the mod to shorten up its hang time.

From russell1@intgp1.att.com Tue Apr 19 15:10:00 1994
To: copeland@metronet.com

>Unfortunately the "hang time" of the voice activator is nine seconds.
>This is to long, wastes tape between police call transmissions.
>
>DOES ANYONE HAVE SCHEMATICS FOR THIS YET?
>
>WHAT RESISTOR CONTROLS THE HANG TIME?

I was looking inside the CTR-76 and found that capacitor C23 was part
of the RC circuit for the hang time. I put a 12K ohm resistor in
parallel with C23 and now I have a very short hang time (maybe too
short depending on your needs, less than one second).

[try 10k-20k resistor]

Source record: 264104

I bought a Trident TR2400 from ACE and they said they supplied mods for receiving cell freqs, but when I received the unit the mods were a list of image frequencies that mapped to the cell band. It could receive the cellular tower frequencies, but not the cellular mobile frequencies.

When I called them to see if I could receive the real cell frequencies, they said they could not comment on it. I assume it can't receive the cell frequencies because they told me about other models that could.

My TR-2400 died after about an hour of using it, and I returned it.

In the hour of using it, it was a really great scanner. I have a Radio Shack Pro-51, and the TR-2400 was bringing in signals the Pro-51 couldn't, and it was much clearer.

If it didn't die, I would have kept the TR-2400, but they talked me into a different model. I'm not a cellular listener, but I figured since I'm buying a scanner, it might as well receive the whole range whether I use it or not.

By the way, the people at Ace were very pleasant to deal with, and they shipped the unit within a couple of days even thought they said it would take about 2 weeks.

Are you sure it's the LCD itself that is blown?

A couple of years ago, the display on my 800XLT started acting up.
It would take longer and longer for the display to come on after
I turned on the scanner. The scanner itself worked fine, I just
couldn't tell what channel was being received. Finally it gave up
completely which is usually the point where I put the paying repairs
aside and fix my own stuff.

After a few phone calls to Uniden, only to find that they wouldn't sell
me a service manual (which takes them off my Christmas list), I finally
received a 5th generation or so one page copy of a schematic.

A little studying, a little probing, and a little solder smoke later,
I had a working display and 4(?) little bad electrolytic capacitors
laying by the side. The radio went back on the desk where it sets
today, still working. The caps hit the trash.

If I recall right, it wasn't that hard. I'm sure I was retentive enough
to write up what I did. Gimme a call if you want and I can probably
give you the info over the phone.

BTW, I think it's a vacuum fluorescent display but I don't want to take
a chance of showing my spelling faults all over the internet (oops!)

: I have noticed advertisments in various scanning magazines
: refering to methods of turning a cellular phone into a cellular
: frequency scanner. The ads make it sound like all mods are done
: directly through the keypad, using test modes (or something like
: that). Anyone have any information on this?

The less complex way to "scan cellular" is via entering channels and enabling audio from the keypad of several different models of cellular phones. The most common phones to do this with are the Motorola and Oki series. This is a very difficult way to monitor because you can not sweep though the channels. You can only lock onto one frequency and hear everything that is going through it.

There are companies that make kits for the Icom 7000 receiver to turn it into a cellular monitor that will enable you to enter a cellular number and track it as it goes from tower to tower, channel to channel. Another company sells a similar software and cable setup that will enable an Oki 900/1150 to function in this same way. It sells for $400 however.

For more details on this, check out alt.2600. There are several discussions as well as keyboard commands to get into cellular programing mode that will allow you to listen in.

: Is it a worthwhile unit? What frequency ranges (as exactly
: as possible) does it handle? The ad isn't very clear. Is the
: handheld range decent? Is battery life ok? Spare batteries
: available? Does it receive all 800/900 MHz freqs, or can it be
: fixed?

The pre March '94 models can be restored by moving a resistor from one pad to another. My friend purchased a refurb from Damark for that same price and we modified it without any problems. His unit did have trace wires soldered on during the repair to fix problems that mine did not.

I am very unhappy with the battery life, but very happy with the scanning speed. This is the fastest handheld scanner and it is very easy to follow conversations as they change from channel to channel. Batter life will give you 4 hours as compaired to the previous model that will give around 8 hours of use.

Spare batt's are available thru Uniden, and it has pretty much continuous coverage from 20 to 1300 Mhz. The cellular must be restored, and there are some government freq's missing.

: suffer. Or are the AR8000 electronics so superior (selectivity,
: rejection etc) that it could handle an external antenna with performance

: equaling or exceeding a dedicated base station such as the 2006?

I've found the AR8000 to be a very good unit for a base station. I live in Atlanta and there is quite a bit of RF around. Connected to a discone there is some overload, but little or no intermod. Someone posted a message about using a RS variable attenuator to cut down on the intermod. I bought one the other day and it works great. The unit only cost $7.00 and attenuated from 10 to 20 db. Some bands do not require it so you just turn it off. When I scan a bank, the S meter will light up if overloaded. Simply turn the knob until the marks disappear. At that point you have eliminated the overload and the antenna system is set for maximum reception.

:The main problem has been the radio's small size - you can't just reach
:over and hit a button or spin a knob.
: --

Yes, you read that right... 101. Does anyone have programming information handy for this (somewhat old) model? I can't find the manual and it's been years since I programmed it. I know the process consisted of entering a division scale factor in binary on the 16 channel-enable switches (no keypad here :) and hitting the enter switch, but the details escape me. In particular, I don't remember the magic number to divide into...

Thanks,
Dan Lanciani

Determining the BC101 programming codes:

Low Band (30-50 MHz)
A. Multiply frequency by 200 and round to nearest whole number
B. Subtract number obtained in step A from 10340.
C. Determine the binary value of number obtained in step B. The
binary value is used to determine the position of switches
1-13. "1" represents "up", "0" represents "down".
D. Switches 14 and 15 are "up".
E. Switch 16 is "up" for delay, "down" for no delay.

Low Band (146-174 MHz)
A. Multiply frequency by 200 and round to nearest whole number
B. Subtract number obtained in step A from 36940.
C. Determine the binary value of number obtained in step B. The
binary value is used to determine the position of switches
1-13. "1" represents "up", "0" represents "down".
D. Switch 15 is "up".
E. Switch 16 is "up" for delay, "down" for no delay.

U & T Bands (416-512 MHz)
A. Multiply frequency by 80 and round to nearest whole number
B. Subtract number obtained in step A from 40964.
C. Determine the binary value of number obtained in step B. The
binary value is used to determine the position of switches
1-13. "1" represents "up", "0" represents "down".
D. Switch 14 is "up".
E. Switch 16 is "up" for delay, "down" for no delay.

To program:
A. Put "ready" switch in the down position ("channel program"
light will come on.)
B. Set the switches 1-16 in the down position.
C. Manually step through the channels until the light above
the channel you wish to program is lit.
D. Set switches 1-16 in appropriate positions for the desired
frequency.

E. Push the "enter" switch down and release.
F. Repeat steps B - E until all channels are programmed.
G. Put the "ready" switch in the up position. (Switches 1-16 now function as channel lockouts.)

> This one is at the same level of quality as the ones shown in
> the Grove and National catalogues, but at $60 it is a steal.

I've had the #2 version on a tower for a few months and I did notice one disturbing thing last time I had the tower down (to service the TV antenna). The screw inserts on the ends of the long elements of the discone (the short elements are solid and don't have inserts but the long elements are hollow with crimped-on screw inserts) have become quite loose. At first I had thought that the elements were no longer tightly screwed in, but it really is the crimp-points that have come loose. Whether this will progress to the point where the elements fall off or whether they will just sway a bit more in the wind I can't tell...

Thanks, I had a list that I got from ShackToo BBS, but it's almost 3 yrs old and I'm not sure how accurate. Do you knwo where I can get some of the Wayne Ct freq's, such as Palmyra PD and Newark, etc?

7067. Pro 2006 Mods -- Better reception?

Newsgroup: rec.radio.scanner
Date: 1994-12-19 03:47:41 UTC
From: AKRR70B@prodigy.com
Message-ID: <3d2vot$3a7m@usenetp1.news.prodigy.com>
Source record: 263740

I've heard that by cutting one of the diodes (I already cut the one for cellular restoration) you can increase the reception quality. I've also heard that doing this has "side effects" including losing total reception of some frequencies, among other things. Can someone please fill me in on the truth--preferably someone who has already done the cut--and what the real side effects are, if any?

AKRR70B@prodigy.com

7068. Light on BC200XLT

Newsgroup: rec.radio.scanner
Date: 1994-12-19 04:06:41 UTC
From: darian@MCS.COM
Message-ID: <3d30sh$p1a@Mercury.mcs.com>

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone know of a mod to keep the light from timing out on a BC200XLT? I keep my scanner plugged into a DC charger in my car at all times. Probably not the best thing for the batteries, I know. I would like to be able to use the light button as a toggle...in other words, press LIGHT and the light stays on until you press LIGHT again to turn it off. Anyone know how or if this can be done?

Much thanks!!

At last count, my collection contained three BC-101s :-)

Terence Brennant sent me this BASIC program back in October 1993.
I've shared it with other BC-101 users but haven't tried it myself.

```
| From att!delphi.com!BRENNANT Sat Oct 16 01:01:41 1993
|
| Hi -- Actually I am not a BC101 user. The program is written in BASIC and
| is quite brief. I wrote it for a fellow who has a BC101 that he is
| sentimentally attached to. It was his first scanner, and it still works
| well. Looking up switch settings is very tedious, and some frequencies are
| not even in the list. He is using it with an 800MHz converter to listen
| to the local trunked system, and the converted frequencies are not in the
| book. It works well for this purpose, and 16 channels is adequate.
|
| Since the program is short, I might as well include it with this message,
| so here it is:
|
| ------------------------------
|

Hello all. Please correct me if I am wrong, but was some information posted earlier about putting the Oki 750 Cel phone in Service mode? If so, I have missed it, and would apprecate a repost. I am going to a big city soon, and would like to have some fun.

Thanks!
Armageddon (jeevan's 2nd user...)

Please reply in the newgroup, so I can access it thou aol (gak!) in the place were I am going...)

Note that Listening to Cellular Telephone conversations is Illegal and is not endorsed by me.

7071. Re: 220 MHz business heard (sort of)

Newsgroup: rec.radio.scanner
Date: 1994-12-19 05:57:31 UTC
From: mulligan@ACM.ORG
Message-ID: <3d37cb$e7q@hopper.acm.org>
Source record: 263726

100 (of the 200) channels in the 220 MHz band are set aside for local trunked (or equivilent) use. The "QT" service code indicates a 5-channel commercial trunk. Since the bandwidth is only 5 kHz, users are apt to be digital, such as a UPS truck reporting a dump from the clipboard.

220.1925 would be part of .0425, .1925, .3425, .4925, and .6425.
Bases are on 220.xxxx, with the mobiles 1 MHz higher.

Source record: 263727

willybg@primenet.com (Bill Moloney) asked:

> ... trunk systems ... Do I correctly have an understanding of the concept?
Yes.

> ... telephone patches not related to the pd ...
The largest use of government phone patches is for personal business. If it
was an official matter, it could probably be handled via the radio system <g>.

> ... I am receiving cellular calls in the upper 800mhz and 900mhz freq.
It's an artifact of your receiver called 'imaging'. You will probably find
you're hearing the calls shifted 21.4 MHz from their actual frequency. Read
the Police Call section titled "Frequency Mixing" (pp 12-13).
For reference:

From the FAF - Frequently Asked Frequencies
on oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

Cellular Telephone [22.902]

Chs Freqs (base) System

800-832 869.040 - 870.000 RCC - voice
1-312 870.030 - 879.360 RCC - voice
313-333 879.390 - 879.990 RCC - data
334-354 880.020 - 880.620 Telco - data
355-666 880.650 - 889.980 Telco - voice
667-716 890.010 - 891.480 RCC - voice
717-799 891.510 - 893.970 Telco - voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are 30 kHz apart.

7073. REPOST:-> FOR SALE:Yupi MVT-8000 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-12-19 06:30:11 UTC
From: baranowski@aol.com
Message-ID: <3d399j$34o@newsbf01.news.aol.com>
Source record: 263728

SORRY For the repost here guys...It seems as if AOL knocked it off their news server....

For Sale

Yupiteru MVT-8000 Base scanner. (UNCENSORED, of course!)

Specifications
==============
Coverage : 100KHz - 1300MHz with reduced sensivity below 8MHz
Modes : AM, NFM & WFM
Increments: 5, 10, 12.5, 25, 50 & 100 KHz
On WFM 50 & 100 KHhz only)
Channels : 200 (In 10 banks of 20)
Search : 10 banks with user definable limits, mode & increment steps
Scan Speed: 15 channels per second (approx)

The unit is in MINT (and I mean MINT!) condition, as it's been stored in my file cabinet at work (and yes, it DOES work). It has approximately 3 hours of usage on it. The unit is noted for is SMALL size and FULL coverage (can you think of another base scanner that will pickup shortwave?)

For those unfamiliar with it's petite size, look in library #2, as I uploaded both a GIF and JPG of the unit last year.

Price: $375 COD
Shipping: I'll ship 48 states ground

If interested, please EMAIL to baranowski@aol.com

Thanks for your time..
-Mike Baranowski

>enough output power.

If I were to come up on the input freq to the cell site, the other user on that channel would likely hear me - briefly. I don't recall if the cell phones transmit supervisory audio tone (SAT) when you force transmit in test mode. If SAT is not present, that call won't stay up.

But you're right about the 45 MHz split I wasn't thinking about that when I wrote my opinion - that is: the idea of intenionally jamming a cell phone is a stupid idea.

7080. FCC Database questions

Newsgroup: rec.radio.scanner
Date: 1994-12-19 13:47:02 UTC
From: fa419@cleveland.Freenet.Edu
Message-ID: <3d42sn$g5m@usenet.INS.CWRU.Edu>
Source record: 263736

I've recently gotten the FCC database from Grove for my state and while I never thought it would be a Bible for frequencys, (I gotta scan it to believe it!) several things about it surprised me and I'd like to get some explanations from some older hands... for instance...

1. Approximately 1/3 of the records are duplicates. I'd like to believe that since Grove doesn't include all the fields that there is some thing in the other fields that makes these records unique. Is that the case?

2. The number of inaccuracies when it comes to the City and/or County of a station are incredible. The City may be right but the county is wrong or vice versa! Is the FCC just dumping whatever data they get on the application into their database without any verification? Even if this is the case, how could there be so many mistakes from the applicant?

3. If a station is listed with no LAT/LONG information, does this mean it's a mobile station? (I haven't looked closely at the emmission codes, maybe it's indicated there.

4. It's hard to quickly easily tell if the frequencys listed are in use by the listed agency/business, but I know of several active. 'well known' stations that are operating on frequencies that aren't listed in the database. In other words, stations that should be listed, ain't. Why? A application to new to be in this database release? Doesn't seem likely.

5. For a given frequency, in a given city there are many different users listed. From the antenna height, power etc, I don't see how it would be possible for them to operate simutaneously without interfering with each other. Are some of these outdated licenses? Some kind of time sharing going on?

So, I use this list like my other references, if I hear something that I can't identify, I look it up and ~sometimes~ get pointed in the right direction. Hey, I'm not whining, I only trust what I hear, but this database doesn't seem to come close to what would be considered trusted or even usable as a source of good information by ordinary business standards... (*Am I gonna get flamed by the FCC for this? :) *)

7087. 855xlt mod question

Newsgroup: rec.radio.scanner
Date: 1994-12-19 16:52:49 UTC
From: jimz@infinet.com
Message-ID: <3d4dp1$3vu@rigel.infinet.com>
Source record: 263744

I recently grabbed a text file on how to modify the BC855XLT scanner for both continuous 800 mHz coverage and an additional 50 program channels. But at the end of the file, it states that this mod only works on older model scanners. It warns that newer models will be fried if the mod is attempted.

The scanner that I would like to modify is my father's, and I've already cooked his stereo in the past week. I see my parents once every few months, so if I cook his scanner and his stereo within a week, I may never see Christmas at home again!

Are there any serial number guidelines (like the pro-43) to denote which models are cellular capable, or is there a place on the unit to check a manufacture date? Any help would be appreciated!

Oh yeah, his scanner is about 2 years old.

Thank you. I have learned something. I have a terminal hear at work
(portable) that I use about once a year for emergency drills. I have never
paid much attention to it but it's digital (9600 I think). It's
easy to use and can be set up in 10 minutes. I have never taken the time to
learn about it.

We have one in Nigeria (permantent) for making reliable calls. It may be
analog - I don't know. I do know that we pay something like $30/min to use it.

I will forward you a list of email addresses of folks
that have inquired about it. I have given up on PING.COM here
in Atlanta, their local service sucks BIG TIME. They are
trying to run a first class operation without sufficent funds
to do it right. The bought the worlds junkiest modems at
lest then $80 each to connect people with. They can't even connect
properly 80% of the time now. Supposedly they have over $50,000
worth of modems on order. I no longer believe this bull.

I will set up a series of files shortly on crl.com regarding the
AR8000 where one can ftp info from which will help supplemnet
your mailing list.

7096. SSB on AR8000

Newsgroup: rec.radio.scanner
Date: 1994-12-19 20:37:46 UTC
From: perryp@iia.org
Message-ID: <3d4quq$q5l@ankh.iia.org>
Source record: 263755

Has anyone noticed that SSB reception on the AR8000 is not as clear as on the Yupiteru 7100? I find that the audio sounds a little strange and I can't get as much of the "Donald Duck" sound out of it as I can on the Yupi. Of course neither is as good as my HF rig.

I also notice that there seems to be a higher noise floor on the AR8000 than the Yupi, but it also seems to have louder audio.

Any observations would be appreciated.

Thanks.
Paul, WB2ERY

7097. Couple uses scanner to protect themselves

Newsgroup: rec.radio.scanner
Date: 1994-12-19 20:48:48 UTC
From: permisch@mcimail.com
Message-ID: <3d4rjg$6u6@hermes.dna.mci.com>
Source record: 263756

A Jewish family in Evergreen, Colorado, used a scanner to monitor their neighbors plans to intimidate them.

My apologies if someone's posted this already - I don't follow this newsgroup that closely. I also apologize for not providing any followup articles to this one since it's publication - I don't follow the RMNews all that closely either.

Anyway, I thought it might be interesting to this group in it's reference to cordless phone monitoring. If someone wants a followup on this, please do not contact me -- call the RMNews directly or the JeffCo DA office.

Paraphrasing from the December 10, 1994 Rocky Mountain News article by John C. Ensslin:

Jefferson County DA will prosecute an Evergreen (mountain suburb southwest of Denver) couple and their neighbor accused of harassing a Jewish family. William Quigley, 43, his wife Dorothy, 39, and their neighbor Joy Mudd, 41, will face charges of consipiring to commit ethnic intimidation against Mitchell and Candice Aronson.
The Aronsons compiled 12 audiotapes they recorded of cordless telephone conversations between the Quigleys and Mudd. Some high points:

- "You should have seen her (Aronson's) face," Quigley is quoted in telling his wife how he gunned his engine in a confrontation between his BMW and the Jeep that Candice Aronson was driving.
- Dorothy Quigley referred to the Aronsons as "those (expletive) loud New York Jews."
- Dorothy Quigley told Mudd how she lured the Aronson's dog into her yard, then reported to animal control that the animal was running loose. (The Aronsons were cited for this)
- The same neighbors talked of painting the side of the Aronson's house to look like a large oven. Also, there was talk of throwing lampshades and bars of soap into the Aronson's yard "to give them a hint." Both of these are Holocaust references (the Nazis turned the bodies of prisoners into soap and lampshades).

The article then says the Aronsons used a scanner to pick up the conversations. A comment from a DA spokesperson referred to the illegality of _recording_ cellular phone conversations but that there may or may not be a loophole for cordless phone conversations (the spokesperson was not clear about current law at the time of the interview).

> Mike

It sure would, but I highly doubt they're using any sort of
ECCM techniques, other than perhaps having a secondary repeater input
channel.

One of the reasons for 10-codes, is a quick way to get the information out. With Computer AIDED Dispatch, the computer requires the code. For NYC, the code for a robbery Inside a commercial establishment is 10-30C1. Whereas the dispatcher will recite, respond to a robbery inside a commercial establishment. The cops on the street do not know the expanded code because the expansions are for the computer and statistical unit.

10-54--ambulance needed along with RMP. Expansions back in my day.

54C1-cardiac inside location
54C2-Cardiac outside location
54C3-Cardiac CPR performed.

54S1-Serious inside
54S2-serious outside

54I1-injury inside location
54i2-injury outside location

54Q1-other important inside
54q2-other important outside.

Stuff like that for NYPD

7100. Frequencies for the state of Pennsylvania?

Paul don't you think it may be the tighter ssb filter in the Ar8000?
Too wide in AM , narrow in SSB. Not bad for CW.
Have you tried listening with an external speaker?

Personally it dosn't bother me all that much. But then I am used to a variety
of radios as I am sure you are also.

Dan, I noticed on my old discone the same problem. Also, after an ice storm one early spring, several of the elements (the long ones), actually broke off. The weak point apears to be the center of that part that the stainless is crimped onto. On inspection, they actually looked like they were made of pot metal or some other brittle metal like that. I can't vouch for the other brands. But I don't think I would buy another R/S one for that reason. Too bad the entire element isn't made of stainless. I'm wondering if the disimilar metals had anything to do with making that threaded part more brittle.

Just my $.02

Message-ID: <19DEC199419543611@vax2.concordia.ca>
Source record: 263953

I thank all the posters that pointed out the weakness of the R/S discone. Now that I know about it, I'll reinforce those points with a little fibreglass resin before I put up the antenna. I've used fibreglass resin at other times with super results. The resin hardens to an almost indestructibe bond that weatherproof the area, provides super strength reinforcement, and is almost completely RF transparent past 1300 MHz. Best of all, it's easily available (any store that sells automotive or marine products) and it is cheap.

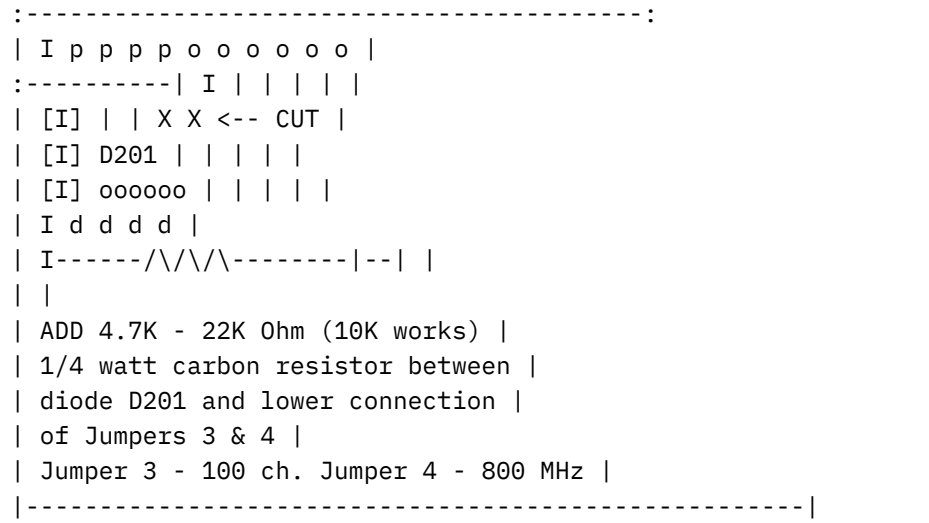
UNIDEN BC-855XLT MODIFICATIONS (OLD BOARD ONLY)

NOTE: use ONLY on boards marked PH-120AE.... use on any other
board will COOK your Scanner

Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.



1 2 3 4
I p p p p o o o o o o
I
[I]
X X <-- CUT
[I] D201
[I] oooooo
I d d d d
ADD 4.7K - 22K Ohm (10K works)
1/4 watt carbon resistor between
diode D201 and lower connection
of Jumpers 3 & 4
Jumper 3 - 100 ch. Jumper 4 - 800 MHz

1. Remove 5 screws from bottom of scanner case.
2. Carefully separate case top and bottom.
3. Unplug connector to the internal speaker.
4. Locate diode D201 and 4 jumpers near edge of circuit board.
5. Cut the 3rd and 4th jumpers near the middle and fold
downwulate leads, if necessary.
6. Connect the lower part of jumper 3 & 4 to one end of a 10K
Ohm 1/4 watt carbon resistor, insulate all exposed leads.
7. Connect the other resistor lead to the lower connection of
diode D201, DO NOT cut any leads on D201.
8. Make sure all exposed leads aren't touching any other
connections, insulate as required, tack in place
with a dab of RTV silicone, or low temp hot glue.
9. Reassemble scanner, make sure to plug the speaker back in.
You should now have a scanner with 100 chs. numbered 01-00 s
in 5 banks of 20 ch. and continuous 800 MHz coverage.

** This information for educational and lawful use ONLY **

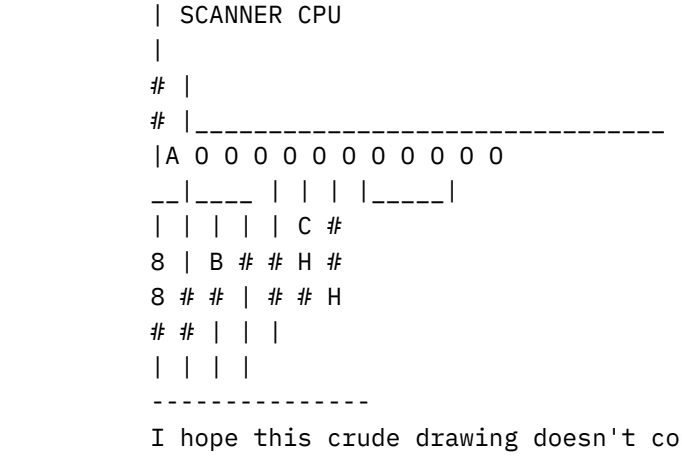
USE ONLY AT YOUR OWN RISK! Neither the author nor the poster of this instruction file
claims any responsibility towards damage to equipment.

NOTE: This mod is for _older_ models of this scanner!!! The reported new boa
rd _will be destroyed_ if this modification is used.....

BC 855 XLT Modifications (NEW BOARD ONLY)

First of all, This mod is for newer BC-855XLTS with circuit board labeled
"PH-120AF" ONLY.
1. remove antenna and power from unit.
2. remove cabinet from unit.
3. locate circuit board attached to the top panel and remove the screws
holding it down.
4. locate the chip jumper shown by "H" below; apply heat with soldering
iron and remove it carefully, using a desoldering tool or wick. Save
the chip incase you wish to restore for warranty repair later.
5. Cut enough lead to route the 10K resister between point A and C or
alternately Band C. Scrape the green insulation off circuit at C or
solder directly to chip at B. Solder the other end of the resistor to
the upper pad where you removed the chip jumper in step 4. Be sure
to slip a bit of insullation on the leads of the 10K resistor to ensure
it does not short against anything
6. Reassemble by reversing steps 1, 2 and, 3. Test by entering a
frequency
between 869 and 894 MHz (870.000MHz).

NOTICE : IT IS ILLEGAL TO MONITOR
CELLULAR CONVERSATIONS IN THIS RANGE



I hope this crude drawing doesn't confuse you.

LEGEND:
O = cpu leads
8 = coil or inductor
A, B, C Points to solder 10K resistor
H = chip jumper to remove.
# = chip resistor or diode
| = vertical circuit trace
_ = horizontal circuit trace

: I recently grabbed a text file on how to modify the BC855XLT scanner for
: both continuous 800 mHz coverage and an additional 50 program channels.
: But at the end of the file, it states that this mod only works on older
: model scanners. It warns that newer models will be fried if the mod is
: attempted.

I resent a list with _both_ mods on it. It should appear on the net soon.
It tells you to look at the circuit board. Different numbers require
different mods. The number on the board is listed, and you can apply the
proper mod. The older scanner you have should be modded according to the
previously sent mod sheet. But still, look at the circuit board number.

I'm also looking for a mod that will keep the display backlight ON once
it's toggled, instead of automatically going out after a few seconds. I
use my unit on AC power much of the time, so power drain isn't a concern.
Anyone know of a fix for this?

> Wayne Ct freq's, such as Palmyra PD and Newark, etc?

The list I posted should pretty much cover the region. The four main frequencies you need to worry about in Wayne County are the fire dispatch (46.440), EMS dispatch (155.940), Sheriff's primary (154.845), and the countywide local PD frequency (154.725) -- from the best of my knowledge, all the local cops in Wayne County use that last frequency. Other channels to keep an eye on also include the State Police Troop E frequencies (154.905, 154.770, 155.625, 155.565) -- they do some of the primary policing duties in some of the towns.

Glad to help -- happy hunting!!!!

7114. Re: 800 mhz questions

Newsgroup: rec.radio.scanner
Date: 1994-12-20 03:25:00 UTC
From: brian.parker@nohobbs.org
Message-ID: <941220070515312@nohobbs.org>
Source record: 263957

BM-{General question. I live in an area where the PD is on 800mhz trunked syst
-{ I have read the information in the Police Call book about trunk systems an
-{if what i read is correct, a computer switches transmissions to the next
-{available frequency. This is opposed to each channel having its own frequen
-{ While I have been listening, this appears to be true. Do I correctly have
-{understanding of the concept????

You have the general concept except that trunked systems can be
designed so that the next channel may not be the next one they
actually transmit on. Say the Police are using channels 2,
4, 10, and 20 on a trunked system just because the first transmission
is on Channel 2 the next transmission may not be on channel 4.
Also note that they can be on certain frequencies today and
tomorrow they might be on different ones.

BM-{Next, while listening to the channels owned by the local PD, I heard teleph
-{patches not related to the pd or the local government agencies using these
-{800mhz channels. Why is that??

Some of the 800MHZ systems allow the operator (the person with the
radio) to make personal calls, even if it's not a police officer.
Again it all depends upon how the trunked system is configured.
Also I've notices some call boxes on the side of the road also use
the 800MHZ system the city also uses.

BM-{Also, It appears that I am receiving cellular calls in the upper 800mhz and
-{900mhz freq. I thought I was not able to receive cellular calls?? R these
-{really cellular calls? What are the general cellular mhz ranges

BM-{Lastly, anyone out there have an opinion on a Radio Shack Portable model 39
-{It has 200 channels, searcable upper and lower limits and receives 800 and
-{freq? Also is there any way to increase reception while the unit is in the
-{house? Outside antenna? suggestions

I like the Pro 39, the 800-900 runs between 806-823.9375
851-868.9375,896-960 MHZ. The is a mod to be done to the
unit I'll try to find the site if your interested.
I find in the house the best "hot spot" is close to a window
but that all depends upon the structure of your house. I haven't
tried an outside antenna because I haven't felt the need.

Brian

7115. PRO-39 mod. on 1995 unit?

Newsgroup: rec.radio.scanner
Date: 1994-12-20 03:53:34 UTC
From: kah005@acad.drake.edu
Message-ID: <1994Dec19.215334@acad.drake.edu>
Source record: 263770

I have recently purchased a Pro-39 (20-303) scanner which is in closeout this month. However I am concerned about making the cellular mod. on the unit. If anyone has noticed, Radio Shack is dropping many of their brand names for 1995; names such as Realistic, Micronta, Duofone, etc. Most of their products now carry the old, familiar Radio Shack logo. I bought the unit because I knew there was a mod. available for it. However, the scanner has the Radio Shack logo instead of Realistic, indicating to me that it is a 1995 unit. Does this mean that the mod will not work? (Mod. consists of removing diode D6) I am concerned that since it appears to be a 1995 unit, the cellular freqs. may truly be blocked out. I would prefer not to take the unit apart if the mod. will not work. I drove all over town hoping to find some older stock (Realistic name) but was not able to find anything. The picture in the sale flier showed a Realistic unit.

Makes me wonder, is it possible RS wanted to sell the unit for 1995 but could not because it is still modifiable? Or did Radio Shack just decide to can the model even though they may have made some changes?

I am sure this has been discussed here before, but at which date may "easily modifiable" no longer be manufactured? (Sorry to dig up an old subject)

I would love for my unit to be easily modified. However I would like to know before I open the box and actually use it, since I may return it otherwise and buy something used.

I do realize that listening to cellular freqs. is illegal, so I am asking this question merely out of personal interest of course.

On a different subject, anyone know of a good vinyl protective case that does not block the use of the buttons?

Thanks very much!

Kris Harris

Newsgroups: rec.radio.scanner
Subject: Use of AM/FM vs CB antenna for mobile scanner in wide freq
Summary:
Followup-To:
Distribution: usa
Organization: Jet Propulsion Laboratory/Section 331
Keywords:
Cc:

I want to minimize cost and purchasing antenna.

I want to scan from my car using a hand held scanner that
covers a wide range, 5 Mhz to 1300 MHz.

Option 1: Use my car AM/FM antenna. Need to buy a Y-splitter
to split antenna to a motorola and BNC. ~Cost $20.

Option 2: Buy a magnet mount CB antenna (I don't have a CB yet, but am
thinking of getting one in the future for traveling.) with
a BNC connector. ~cost $30.

What are the pros/cons, strength/weaknesses of these two options.

Thanks for any information.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I see a slow but steady stream of individuals inquiring as to where they can find mods for their Bearcat 200xlt. As we all know, a good mod is like 'the cherry on top' of an already fine scanner, and potentially the best part of a not-so-fine scanner. Might I direct anyone looking for Bearcat mods to the following ftp site:

oak.oakland.edu /pub/hamradio/mods/uniden/bearcat

This directory has more than 20 mods for Bearcat scanners, (while this ftp site has an abundance of mods for all makes and models of scanners), with about 5 or 6 specifically for the 200xlt. Mods include repairing a faulty battery indicator, speeding up the scan/search rate, restoring cellular coverage, etc..

Cheers, Dave

Mark,
Try scanner world (I think they are located in Albany, NY). You
may also want to try Alexander Batteries (Mason City, IA 50401). I know
scanner world carries many scanner batteries, and Alexander carries
batteries for just about everything under the sun. Happy hunting!

7119. Scanner 4 sale

Newsgroup: rec.radio.scanner
Date: 1994-12-20 11:33:43 UTC
From: stegner@richmond.infi.net
Message-ID: <stegner.2.000B903C@richmond.infi.net>
Source record: 263933

I have the following for sale:

Package 1 --- $1000
PRO-2006 and PRO-43 with HB232 computer interface installed in both with
software
GRE Preamp
Grove PRE-4 preamp
Scanner Mod Handbooks 1 & 2
Sherlock 3.0, ProXport, ProScan

Package 2 --- $600
PRO-2006 with OS/456 computer interface installed
TCF-4 CTCSS tone finder installed
Probe and Scan Control for Windows software
Percon and Grove FCC CD-ROMs w/mapping

Package 3 --- $60

Bearcat 20/20

Respond via email if interested.

>the handset frequencies are 824 - 849 Mhz. There are about 1,000
>frequencies to search in each of those bands, so in searching those

Actually, you'd only need to enter about 16 , ie one cll cell's worth,
assuming you were scanning from a fixed location and wanted to listen ti
the nearby ccell. Cewlls are programmed to only xmit on a specific
group of frequencies, and once you find one, al ther rest fall in
line with a .63 MHz spacing.
I have a full list of cell spacing, its also in US Scanner Pub's
state by state frequency almanac. If anyone wants mine, e-mail me

and I'll fax it yto you. I need a fax number in the e-message.

7122. Wanted: AR-3000(A) Technical Instructions

Newsgroup: rec.radio.scanner
Date: 1994-12-20 13:41:22 UTC
From: deutsche@sun2.ruf.uni-freiburg.de
Message-ID: <3d6mu2$7mn@sun2.ruf.uni-freiburg.de>
Source record: 263928

Hello,

I am looking for a Technical Instructions Manual for the AOR AR-3000A. I already have a bad photocopy of the HF/IF-Board-scheme, but I need a better base to make more modifications (filters, etc.). Theoretically, a manual is available here in Germany, but 1) it costs 130 DM (about 80 US-$) and 2) I didn't buy my rig from the official german distributor, so they won't sell me a manual.

So if anyone has such a technical manual and could make me good photocopies of the schemes and the printed board layouts, please send me a E-mail. Of course I will cover all expenses (photocopies, postage...).

Thanks in advance for reading this article and perhaps replying...

Udo Deutscher, Freiburg, Germany

Indeed, I would like that mod too. I hate the light going out on it's own!
I've noticed that you can keep it on by pressing any key, since it seems to
time the interval since last key press. But sometimes there isn't an
appropriate key, one that won't change what you're doing.

I have some low power digital transmitters in my area that I'd like IDed.
These would be business band in a database.
461.6625 WNXX420 Target
464.3375 WNYX988 Albertson's?
The Target used to have a different call (WNZF527). What are these things
used for anyway? Dillard's at the mall uses them too.
City of transmission is College Station and County is Brazos. If anyone has
a more up-to-date database or a nationwide one (if they brought them in from
somewhere else) I'd appreciate someone letting me know who these calls come
back to.

I'll second that. You'll see some mild flame wars about political posts, but
now that you've msde me reflect on it, I can't recall a single case of the
intellectual bullying (using knowledge as a club and trying to make the poser
of a simple question seem intellectually inferior) that is so prevalent in
other groups.

Not necessarily, though it's possible.

>vice versa! Is the FCC just dumping whatever data they get on the application
>into their database without any verification? Even if this is the case, how
>could there be so many mistakes from the applicant?

You'd be amazed. The license applications are obviously filled in by radio
dealers, consultants or whoever, or by business types who really don't know
what county a radio is in, if they can even spell it right. You have to
search out all misspellings imaginable, because FCC will never fix them!
(They'd be crazy to try.) The point is that the FCC database is incredibly
sloppy, almost to the point of humor.

>words, stations that should be listed, ain't. Why? A application to new to
>be in this database release? Doesn't seem likely.

Many, if not most, businesses, and more municipalities than you want to
think just never bother to renew these licenses. The sales droid or
consultant splits, or the guy that's supposed to do it retires, and the
licenses merely expire. After a certain period, they're dropped from the
database, but the radios are still in use. You also have your pirate
operations that never bothered to license their radios in the first place.

>listed. From the antenna height, power etc, I don't see how it would be
>possible for them to operate simutaneously without interfering with each
>other. Are some of these outdated licenses? Some kind of time sharing going
>on?

They're on different PLs, or the channel isn't used a lot, or the channel
is for interoperability and used in emergencies, or they just interfere.
Or all of the above.

>flamed by the FCC for this? :) *)

Turn in your infohighway driving license, you're busted! :-)

Message-ID: <1994Dec20.193550.17036@ll.mit.edu>
Source record: 263943

I'm not really sure who sent in the mods for the Bearcat 855 XLT, but thank you!

But now I have another problem, you gave mods for an old circuit board,
and a new one. I have a circuit board with a different number, so I decided that
it will be easier just to give you all the numbers I could find on my scanner.

Top circuit board: PH120AB
Middle circuit board: PH129AB
Bottom circuit board: PH119AB 1/3

Serial # 15016395
FCC ID AMWUB218
Manu. Date OJIA

There is also the number 1990 on the scanner. I don't know if it's the year or
something else.

Also, can a tone board be added to this model?

Thanks,
Chris

But be aware some CB antennas using shunt-wound design (base-loaded A/S designs) don't work with some scanners. Apparently their front-end design does not work with this type of antenna. This applies also to commercial 2-way antennas of similar design.

Bill...

The AOR8000
A Review by
Mike Ellerson
KE4RQI

Well, after a very long wait the US version of the AOR8000 has finally began shipping in the U.S. Having received one of these "street legal" (read as cellular deleted) versions of this radio, I thought I would take a few minutes and jot down my initial impressions and experiences with using the radio. This is a non-technical review and only reflects my personal experiences in using the AOR8000. I have owned about 10 different scanners over the last few years, but this radio is absolutely the best scanner that I have seen so far. This radio was designed with the true scanner enthusiast in mind. Somebody was listening to what the scanner hobbyist wanted when the AOR8000 was designed. No, it is not perfect and has its warts, but it comes pretty darn close. This is probably not the best radio for the beginning scanner enthusiast, but could be a radio to grow into if you are patient.

BACKGROUND
The AOR8000 is a hand held scanning receiver that covers 500 kHz - 1900 MHZ (less cellular). The radio has a total of 1000 memory locations that are divided into 20 banks holding 50 memory channels each. Each memory can contain the frequency, mode, attenuator setting, and a 7 character alphanumeric tag. The receiver can be operated in AM, NFM, WFM, USB, LSB, and CW modes on any frequency the radio can tune. Tuning is accomplished through either a rotary tuning knob located on top of the radio, slewing buttons on the keypad, or direct frequency entry via the keypad. Step sizes for tuning can be set anywhere from 50 Hz to 999.995 kHz. The scan/search rate is around 30 channels per second. The radio also includes 20 search banks that can be named. Up to 1000 pass channels are available for skipping unwanted frequencies when scanning or searching. There is a BandScope feature that lets you see activity on adjacent frequencies. The scan delay can be set from 0.1 to 9.9 seconds. The radio can be powered from four AA batteries or a 9 to 12V DC power source. The radio comes with 4 rechargeable nicad batteries, charger, metal belt clip, rubber ducky antenna, and a cigarette lighter adapter cable. If that's not enough, there is also an optional RS232 interface (not available in the U.S. yet) These are just the big things, this radio has many more features that will be mentioned later on in the review.

CONSTRUCTION

Case
The AOR8000 is basically constructed like most modern scanners. The

case is a light weight plastic. Usually my first reaction to this is "Hey this thing can't work, it's not heavy enough!" I really prefer my radios to have some heft to them. Of course with surface mount technology everything is getting smaller and lighter. I really wish that scanners were manufactured more like amateur radio handie talkies. Amateur radio gear is typically constructed with very tough plastics that are more durable for portable use. Most of the time you can drop them a few feet onto a hard surface and they will survive. The AOR8000 does have an interesting feature in this area to help prevent dropping the radio. There are rubberized grips on the side of radio to keep the radio from slipping out of your hand if the monitoring activity gets too intense and your palms get sweaty. However, the first time you drop this puppy on the concrete, forget it! If you are going to get this radio, go ahead and spring for the leather case. On the other hand, even with the batteries and rubber duck attached the radio is very light. I like to carry my scanner inside of my jacket pocket. With the AOR8000, you will hardly know it's there. When I have my Yaseu FT530 in my coat pocket, believe me, I know that it's there. Sort of like carrying around a small revolver.

Controls
The tuning, on/off volume, and squelch knobs are coated with a rubberized plastic. This is a nice touch that it starting to show up on lots of radio equipment. One of the knobs on my radio was a bit loose, but seemed to stay on. The rotary tuning dial feels a bit rough, but it seems to work ok. When turning the rotary dial pretty fast, you may notice that sometimes the AOR8000 will not move to the next frequency or function right away. This can be a little disturbing at first, but is really not a problem and is mentioned in the manual. I have had a least one scanner with this feature where the rotary tuning knob would get stuck completely while tuning in one direction. Spacing between the knobs on top of the radio was also well thought out. There is more than adequate room for fat fingers.

Display
The display is very nice. It uses a 4 line dot-matrix format that is much easier to read than conventional LCD displays. It is nice to see a display that features large easy to read numbers for a change. I always hated squinting at those little small displays that come on most scanners, especially while driving. The viewing angle is generally very good, but I wish it was a bit wider. If I lay the radio in the seat of the car, I usually will have to pick the radio up and tilt it a bit to see the display. However because of the large display and good contrast, I can read the information very quickly, hopefully avoiding rear ending the guy in front of me. The green edge lighting for the display could be a bit brighter, but is entirely adequate for night operations. The edge light can be locked on if necessary. This is very nice if you are going to use the radio in your car at night. The AOR8000 would work well for nighttime mobile operation, if you have a mount that would let you tilt the radio at the appropriate angle. The combination of the large display and edge light would work out pretty well for this application. Speaking of the display, it is covered with a large clear plastic window that is roughly even with the face of the radio. My experience with this design is that if you are not careful, you can scratch

the surface very easily. Believe me, on this radio there is plenty to scratch. This might be another good reason for procuring the $29.95 leather case from AOR or a substitute.

Keyboard
I found the keyboard to be a delight to use. The key's have a nice positive feel with good tactile feedback. They are large enough and spaced far enough apart that even if you have fat fingers, there is little danger of hitting more than one key at a time. The legends on the keys and on the radio body are easy to read. I have had more than one radio with skinny keys and the legends were difficult to see because of the color schemes used. There is of course the mandatory BEEP found on most scanners for keyboard input. This can get rather annoying on any radio when you are trying to enter 200 frequencies in the middle of the night with everyone else asleep. But guess what, this one can be switched off! Another very nice thing about the keyboard is that it lights up when the edge light is turned on. I have seen this on a few amateur radio handie talkies, but not on a hand held scanner or many mobile scanners for that matter. I don't know how many times I have gotten up in the middle of the night during the worst thunderstorm of the year with all the power out. Located the scanner to see if we needed to head for the storm cellar then I would have to fumble around for a flashlight to operate the keypad. No need to do this with this radio, all I have to do now is just find the radio. The lighted keyboard also makes night time mobile operation much safer. No more trying to operate the radio by the dome light or street lights. The special keys on the side of the radio are also lighted and somewhat recessed to avoid accidental presses. This was a nice touch also. The side mounted keys include the Function key which is used with another of the AOR8000 keypad keys to access various menus and functions of the radio. The Edge Light key, Keyboard Lock key, and the Monitor key that opens the squelch temporarily for monitoring weak signals. Overall, this is a very solid built little radio when all factors are taken to account.

OPERATION
This radio has some of the most flexible and useful memory management tools I have seen on any radio. The manual is necessary reading to help you understand how they can be used. I will try to discuss a few here.

Manual
My advice to anyone getting the AOR8000 is to READ THE MANUAL! I know we hate to do that, but it might avoid some confusion later. With this radio, it is best done in small chunks or referring to the manual as you need to figure out how to do something. If you read it straight through, you will probably not get a lot out of it. Speaking of the manual, I felt that it was exceptionally well written compared to what you normally get. Everything is explained in detail with good illustrations. There is even a section on antennas and propagation to help you get the most out of the radio!

Entering Frequencies
Probably one of the most hateful aspects of using a scanner is entering

that list of 200 or 300 frequencies that you have collected. I found this function on the AOR8000 to be a logical approach that one can very quickly adapt to and learn to love. On most scanners you had to do something like MAN-10-ENT-PROG-123.500-ENT-DELAY to get the frequency into channel 10 with the delay set. First you had to manually go through the banks to find an available channel and try to remember the available channel when you entered the new frequency. If you were sadistic enough and try to enter all 200 of your frequencies you could wind up with you fingers in a cast at the end of the day. The AOR8000's approach to entering frequencies is much more logical. Just type in the frequency and press ENT. Press ENT again and hold it for a second and the radio will automatically bring up the first available channel in a bank. At this time you can keep going or select a different channel or bank through the keypad or rotary tuning knob. If the channel already contains something, you will see contents flashing to let you know there is something already there. This is great, no more accidentally overwriting that rare frequency you discovered at 2 am in the morning a month ago. I don't know how many times I have done that! You can overwrite the channel or keep going until you find the one you want. Pressing ENT again will enter the frequency into that channel and bank. Pressing ENT again will allow you to enter up to 7 characters for a channel tag. This is done by rotating the tuning knob through a selection of upper and lowercase letters, numbers, and punctuation. Pressing the left and right cursor keys allows you to change position to enter the next character or edit one you messed up. When finished you press ENT and you are done. This may sound a little tedious to see it described, but in practice it is very intuitive and fast. If you mess up, you can press CLEAR or just wait 90 seconds and do not do anything, the radio will return to doing what it was doing before you made this mess. I couple of gotchas here. The radio comes with the Mode and Step selection set to AUTO. This means when you key in a frequency, the radio will try to select the correct mode like NFM, WFM, AM, etc. and the correct step when the frequency is entered. This works well most of the time, but some of the Bandplan data contains steps that may not be appropriate for the frequency you are trying to enter. I found this out after trying to enter our local amateur radio repeater of 146.745 and after 90 seconds the frequency would change to 146.7500. You can very quickly change the step size and everything is ok after that point. I find that the alphanumeric tags are great. When you have several hundred frequencies programmed into a scanner, it is very pleasant to be able to look at the display and say "Oh yeah, that is the TACT56 channel." It also helps you remember why you stuck that frequency in to begin with! You also have the ability to some very sophisticated things like edit the channel contents. You can change the mode, frequency, attenuator, step, and tag. This will save some retyping and entry errors. There are many other things you can do with memory channels, like copy from one to another, move from one to another, and swap from one from another. I have not really found a whole lot of use for these yet, but I am sure I eventually will. You can even delete a channel! One thing that I learned was useful, was to use the feature that allows you to press the Function button just once and then select the 2nd key. To me this was much simpler than trying to keep the

function button pressed while selecting the 2nd key. This makes changing modes and step sizes and such much faster. Changing modes and steps is fast and easy. All you have to do is press Function and Mode or Step and rotate through the choices in the menu with the cursor keys or the rotary tuning knob

Dual VFOs
This is a great idea in a scanner. This allows you to have two frequencies for immediate access if necessary. Some people may also find this attractive for monitoring duplex communications. Each VFO can be set to and individual frequency, mode, and step. They may be very quickly toggled back and forth. Most amateur radio gear has this feature. It is finally nice to see it show up in a hand held scanner.

Banks
The AOR has a total of 20 banks each holding 50 channels. This is a great idea! Most scanners I used had something like 10 banks of 20 channels or 10 banks of 100 channels. The 10x20 and 10x100 models were always frustrating when trying to set your scanner up by service type. When I had 45 aircraft channels to program, I would windup having to have 20 in one bank, 20 in another and 5 in another. Well I always felt that I hated to take up a 20 channel bank with only five channels, so I would usually leave them out. The 10x100 was not as bad, but I would usually like to have more than 10 banks to organize frequencies in. The AOR8000's 20x50 arrangement is just about perfect. There are plenty of banks and channels to organize your frequencies. The banks are labeled A-J and a-j. The lowercase banks can be passworded to keep out prying eyes and fingers. I have not really used this, but some people may find it useful. The AOR8000 uses an idea called bank linking. Most scanners do this in some way, but AOR's way is quite good. Most scanners allow you to add or remove banks from being scanned by pressing the number of the bank you want or do not want to scan. On the AOR8000, you turn the linking feature on and then key in the banks you want to link together for scanning. For example you could scan banks ADGH by entering them into the scan list. If you want to scan a bank that is not in the list, just press its letter from the keypad. For example, I want to temporarily disable the ADGH scan and want to scan just bank B. I simply press B on the keypad. To go back to the linked scan, I press one of the linked bank letters. The bank linking feature can be turned totally off and the radio will scan just the selected bank. This setup may be a little strange if you are used to using GRE and Uniden designed radios, but the more I use it the more I like it. This allows me to do something like link all the public service banks together and not link the bank that contains 2 Meter repeaters. If I decide I want to check activity on the repeaters, I just press the letter of the bank that contains them. The radio stops its linked scan and then goes to the repeater bank to check for activity. If it is boring, I can quickly switch back to my normal linked scanning. There is also a feature to let you delete an entire bank of channels (kind of scary).

Scanning
One thing I really like about the AOR8000 is when you turn it on, it goes

back to doing what it was doing when you turned it off. If you were scanning it goes back to scanning, if you were monitoring NOAA on one of the VFOs, it goes back to monitoring NOAA when turned on. The AOR8000 clips along at about 30 channels per second. Not bad. What I really like about this scanner opposed to most of the models I have used is that it only scans channels that contain frequencies. Most scanners I have seen, usually scan all the channels in a bank. This means if you do not want to scan the empty channels, you have to lock them out. This makes for real fun if you have a lockout review feature and just want to find that one channel that you locked out. Speaking of lockout, AOR calls this feature a PASS channel. If you are scanning and have a channel with some annoying chatter or static, you simply press PASS and the channel is locked out. I like the way that AOR does this. On a passed channel a small p shows up next to the channel number and makes it very easy to see that this channel has been locked out. To un-PASS the channel, just go back to it and press PASS again. To start scanning you press the SCAN button. If you need to hold the scanner on an interesting frequency, you simply press the ENT key. To go back to scanning, just press the Scan key again. I find this to be a very simple way of doing this. Of course channels can be recalled manually via the keypad or stepped through manually with the rotary tuning knob. Stepping through the frequencies with the manual tuning knob is a feature I have always found handy. The AOR8000 of course has a Priority channel that can be set to any one of the 1000 channels. Another very useful feature is the ability to build a favorite channel list from the frequencies stored in the banks and scan just those frequencies. AOR calls this feature select scan. This is a really handy feature. Let us say an event is taking place that you would like to monitor. As the various radio services become active during the event, you can add them to the scan list at the press of a button. When you feel that you got all of them you want to monitor, just turn the select scan feature on. Now you are only scanning the frequencies that are in that list. Neat! Once you are through, the whole list may be deleted. The AOR8000 also lets you customize your scanning in the Expert mode by adjusting the scan delay from .1 to 9.9 seconds. This is nice for monitoring trunked systems, or just lengthening the pause time. The default in the New User mode is 2 seconds. I have not found a way to apply the delay to individual channels, which would be nice. An Audio Scan feature will let you scan only frequencies that contain audio. This allows the radio to pass over open carriers and such. This feature has been around for a while on the PRO-2006 is called Sound Squelch. I am not sure how useful this really is because if the person transmitting is slow to start talking, the radio may skip that channel. The Free Scan feature is typically found in most amateur radio gear. This allows you to set a time limit from 00 to 99 seconds for the scanner to dwell on any given frequency. When the time limit has expired, the scanner moves onto the next channel. This is not too useful for scanning, but good for getting a picture of activity on the channels. The Scan Level setting allows you to set the squelch level required before the squelch will open. This setting is from 0 to 7. This is very nice for not allowing very weak signals or noisy channels from opening the squelch. I am reluctant to use this feature, because I am afraid I would miss that important transmission that was only at S1.

Users who live in strong signal areas or high intermod areas may find this feature very useful. You can also select the Scan Mode. This allows you to mix frequencies with different modes in a bank and have the scanner just scan the ones of a certain mode. For example you could have Aircraft AM frequencies mixed with NFM frequencies in a bank. By using this setting you could just scan the AM frequencies or just the NFM frequencies.

7144. AOR8000 Review Part2 - Repost

AOR8000 Review Continued :

Searching
This radio has to be the stealth bomber of radios for finding new frequencies! Several search methods are available to you. One of the simplest is to search between two VFO frequencies. This is nice for setting up a really quick and dirty search. You can set up 20 different search banks. You program the starting and ending frequency, step, attenuator, and mode. Having 20 of these rascals gives you more room to have very specific search ranges. Some radios give you 10, which I have usually found adequate, but with 20 you can specify smaller chunks of spectrum to be searched. These search banks can also be named, which is a nice touch. This allows you to put tags on them like 2 Meter, 70 CM, AIR MIL, etc. One huge problem that I have always disliked in searching frequency ranges is that there is always going to be spurs, birdies, open carriers, noise, and gosh knows what else. I have to pay attention to the radio constantly when it is searching. I am always tied to the radio pushing a button to get past these frequencies. When I did find one I want to keep, I would usually hit the Monitor button to store it and then move it into a memory channel later. Most of the scanners I used only had 10 of these monitor channels, so eventually I would have to stop searching and move the frequencies I found into memory channels. AOR solves these problems nicely. To get around the problem of the scanner stopping on junk frequencies, you can lock out the offending little rascals with the Pass key (do not worry you can Un-Pass them if need be). You can have up to 1000 of these locked out (50 for each bank) and it will even check to make sure that you did not lock out the same one twice. Now you can just sit back and let the AOR8000 do its thing. When a frequency is found all, you have to do is press the ENT key for a couple of seconds and you are ready to enter it into a bank and channel. If that is not enough, you can link the 20 search banks together much like you can the scan banks. For example, you go to a new city and you want to see what is happening on the 2 Meter and AIR MIL banks, you can link the two search banks and the radio will search them for you. Slick! No more having to search the ranges one at a time or wasting time searching large chunks of spectrum to find those choice frequencies. Now the icing on the cake! The AOR8000 will even Auto Store these frequencies for you into Bank J while you go out and have a nice dinner. The AOR8000 will store the first 50 active frequencies that it finds in the search ranges you have linked. My experience with Auto Storing scanners in the past has been dismal. One scanner I had that had this feature had so much intermod and so many birdies that the first 20 to 30 frequencies it stored was garbage. If I were lucky, I might get 10 or so good ones. With the ability to Pass offending frequencies and link search ranges, you now have very effective tools for finding new

frequencies. Some of the same features that are available for scanning, are also available for searching. I found the Scan Level setting very effective in keeping the radio from stopping on and storing a frequency that was activated by some weak stray RF. For example, at one location the heating system would generate a small pop in the scanner's circuits. The scanner would think that it was a valid signal and try to store it. By setting the Scan Level to 3, the radio would ignore it. You can also use the Audio feature to bypass open carriers. Here again, there are other parameters that can be tweaked to make the search even tighter. Once you have captured some good frequencies, you can copy them to other banks and channels. You can even dump bank J when you are finished and start over. Another way this feature can be used is to Pass the frequencies in the search ranges that you already know about or have stored in the scanner. This way, you will only be finding new frequencies for your area.

BandScope
This feature lets you see frequency activity on either side of the center frequency to which you are listening. The BandScope is made up of 11 bars with the 6th being the center frequency. The bars on the left and right of the 6th bar will show activity 3 kHz from the center frequency for USB, LSB, and CW. For AM and FM, the offset is 10 kHz. This feature can be switched off or on. It seems to work reasonably well. The only penalty is that the audio on the center channel is interrupted every 5 seconds so the scanner can go check activity on the other 10 channels and update the display. I am not sure exactly how useful this, but I am sure that some users will find ways to put it to use.

RF Performance.

VHF/UHF
Sensitivity on VHF/UHF is nothing short of superb. I have had frequencies plugged into my old hand held scanner that I never heard a peep out of. On the AOR8000 these weak frequencies sprang to life. I didn't realize that some of these channels were even active anymore ! Of course I was using both of these radio's with rubber ducky antennas. Speaking of rubber duckies. The one that is provided with the AOR8000 is apparently pretty broad banded. I noticed a major improvement in reception quality by switching to a rubber ducky that was tuned for a narrower chunk of bandwidth. The AOR8000 includes a S meter to help you determine if a given antenna is performing better than another. This is something I think would be handy on all scanners and should be standard equipment. One of the area's I have often seen some sensitivity problems with most other scanners is in the low VHF bands. I realize that part of this is due to the short antennas provided with hand held scanners, but the AOR8000 seems to do very well here. This is the only hand held scanner I have had that will actually receive strong VHF/UHF signals with the antenna removed. One of the problems associated with sensitive radios is usually intermod. I have not heard a bit of intermod on the AOR8000 even on a full sized antenna (your mileage may vary) and we have some killer paging services around here. Any radio around here without a tight front end will get blasted by these paging systems. The AOR8000 just quietly scans along

until a real signal opens the squelch. These paging systems used to drive me nuts, even when I used a PRO-2006 which is very good at intermod rejection. By the way, this radio is also fairly free of birdies and images on VHF/UHF. You will find some as you would with most scanners, but they are noticeably less on the AOR8000. Sensitivity in the FM broadcast band is very good also but if you use a large external antenna, selectivity suffers some in the WFM mode. You may have trouble separating a weak station next to a very strong FM station. This is not much of a problem with whip antennas. The squelch action on the AOR8000 seems to be very good, it is easy to set and you really don't have to fool with it much once it is set. One of the major strengths of this radio is the ability to operate in any mode on any frequency the radio supports. This opens up new monitoring opportunities on VHF/UHF for some users like Military Air, Milsat, 2Meter SSB, 70 CM SSB, 6 Meter SSB, TV Audio, just to name a few (maybe even frequency inversion ?).

Medium Wave
Medium wave AM is not too good. It will allow you to receive some of your strong local broadcasters ok, but you can forget about DX. Of course the manual tells you this up-front, so there are no surprises here. The radio contains a ferrite bar antenna for Medium Wave. You sometimes can improve reception by rotating the radio for the best signal strength.

Shortwave
Ah, this is always the controversial area for this type of radio. The bottom line is, that I was surprised that it worked as well as it does. Don't get me wrong, this is no Drake R8 or even a Sony 7600G for that matter. If you are an avid shortwave program listener or utility Dxer, you would be much happier elsewhere. However, shortwave on the AOR8000 works and it works fairly well at that. The radio has plenty of sensitivity in these bands, but suffers from a lack of selectivity. In other words if you are trying to pick out a weak station between two strong stations, forget it. However, if your goal is to have a radio that is an excellent scanner and just happens to pick up the BBC, then go for it. I found that I had no trouble in picking up a few strong shortwave stations on a Radio Shack collapsible whip. Connecting up a large outdoor antenna brought in even more, and surprisingly, the radio did not overload. If it does, you always have the 10db attenuator to help. You may even hear some faint images from very strong signals on other bands bleeding through occasionally when using a large outdoor antenna. The manual with the AOR8000 offers an explanation of some of the devices that you could use to enhance listening on the shortwave bands. I felt that utility and amateur reception on the AOR8000 was fair to good. Here again, using a very large outside antenna may make it difficult to isolate weak signals from very strong ones. I have heard some users say that they could not get the "duck" tuned out on SSB. My experience is that yes you can. You may have tune off frequency a few kHz to do it. Of course this was not all that unusual with even some of the higher end radios I have used. The AOR8000 frequency display on SSB seems to be relatively accurate. The only major complaint I have here, is that band surfing is a little tedious with the rotary tuning knob or the slewing buttons on the keypad. There is no

variable rate of tuning like on some radios, unless you want to count how fast you can turn the rotary tuning knob. The slewing buttons always work at the same speed even when held down. The trick I have learned to get buy this is to set the step size larger than you normally would use. When you get close to something interesting, decrease the step size. I will admit, that it's nice to have a radio that when you get tired of scanning, you can flip over to the BBC or monitor one of your favorite amateur radio nets.

Audio Quality
The AOR8000 has plenty of audio that is a bit on the bassy side. I prefer this sound personally, it doesn't get on my nerves as much as some of the tinnier radios. What I mean by plenty of audio, is that you can generally hear this radio over the background noise of a moving car with one window rolled down. If your car has dual cherry bomb exhausts then I am wrong, there isn't much audio. However, I find this radio to much louder than most scanners and amateur radio Hts that I have used lately. Audio quality on WFM is pretty good, but you are not going to get a full rich sound through the built in speaker. SSB is a bit tinny, but acceptable. I have tried an external speaker and there is a major improvement in audio quality in all the modes.

Battery Life
Battery life seems to quite good. There is also a power saving feature than can be enabled to further extend battery life. When the battery starts going south, you will see a large Low Battery label flashing on the screen. When using the rechargeable nicad batteries, the Low Battery indicator will flash for awhile and then the radio will go silent. When using alkalines, the Low Battery indicator will flash, but you will also start to hear some weird heterodyning and audio distortion. The first time this happened, I thought the thing had broke. A fresh set of batteries solved the problem. One good thing is that the memory data is stored in such a way that it can not be lost due to dead batteries.

Miscellaneous
The AOR8000 also has some interesting features available in the EXPERT mode like changing the PLL lockup time, the time it takes for the squelch to lock up, the length and level of audio needed when using the audio squelch features, and the length of time for the squelch to activate if the signal level search or scan modes are used. These allow the user to tweak the radio for better or more reliable performance in certain applications. I think I will stay away from these for awhile.

Computer Interface
There is a provision for an optional computer interface on the AOR8000. I have not had the opportunity to use this function yet, but I understand that it will allow you to control most of the functions of the radio via the computer. I have heard it's pretty good compared to even some of those available on higher end radios. This makes sense because a lot of these interfaces were simply an afterthought and not really integrated that well into the radio. One interesting thing that I have noticed is that RF generated from my computer equipment doesn't tear up reception on this

radio as bad (VHF/UHF bands) as most of the other scanners and Hts I have used. However. you will still get some noise on some frequencies from computer generated RF. I wonder if AOR put a little more shielding than normal in this radio. I guess this would be important if you were going to connect the thing to a computer. I am sure as these interfaces become more prevalent, neat and nifty software will start to appear to enhance the utility of this radio even further. We may even start to see users sharing their frequency information across the Internet by posting AOR8000 compatible frequency files !

Conclusion
The more I use this radio, the more I begin to appreciate the thought that went into the design of this unit. It is a very versatile and flexible piece of radio gear that will appeal to the seasoned as well as the novice scanner enthusiast. It appears to me that a lot of thought went into what scanner enthusiasts would like and need and was poured into the AOR8000. I am sure that as this radio proliferates among the scanner enthusiasts, that we will be seeing all kinds of new applications and ways to use this radio. In my opinion, the AOR8000 has the potential to rise up to the cult status achieved by such scanners as the PRO-43, PRO-2006, AOR1000, and maybe even the R7100.

Disclaimers
These opinions and views are strictly my own and do not reflect those of my employer. I have no association with AOR or EDCO outside of being a pleased AOR8000 owner.

7145. Re: uniden 900 mhz phone

:i put my radio shack freq. counter right atop my uniden
:900 mhz cordless phone and it didn't lock on anything!
:when i scan 902-928 mhz, i only get a few dead carriers.
:how does this thing work?

Well, I'll tell you how I understand it. (which may not be totally correct but...) First of all, the uniden converts the audio signal into digital which would make you hear computer noise if you monitored it w/ a conventional scanner. Then, it divides the signal between 4 frequencies . I think that one needs 3 out of the 4 these signals to obtain a contiguous signal. Also, these frequencies modulate via an algorythm common only to the base and handset. As to why your freq. counter couldn't get a lock, I dunno. I stand to be corrected...I would like to hear additional explanations of this phone.
JayS.

7146. Uniden 50xl Battery eater, FIX?

Newsgroup: rec.radio.scanner

My Uniden 50xl handheld has been a battery eater since day one. I don't use it much, but it comes in handy when i want to monitor the local power company during an outage. New batteries last a couple of hours, then i get beeps every few seconds. Works fine on a 110vac to 7.5vdc adapter. Scanner model is BC 50xl by Uniden. Any Ideas???

Thanks Don.....

Your Uniden cordless phone transmits in spread spectrum mode and is unlikely to be detected by a standard scanner or frequency counter. In brief, spread spectrum uses dozens of channels per second (at least) and the amount of power transmitted on any one channel at any one time is to low to be detected by standard equipment.

7149. *900 Mhz Cordless Phones That You Can Monitor

The Sony (SPP-ER1) and Radio Shack (ET-900) 900 mhz cordless phones transmit in anolog FM mode --- they can be monitored with a scanner. Does anyone know the specific channel allocation and frequency spacing for these phones?
Has anyone been successful in monitoring these phones?

PS: I only wish this information for academic purposes and would never, never, never, ever, ever, ever monitor cordless telephone calls.

I would not say that they are "merely taking precautions.." They are
complying with Federal Aviation Regulation (FAR) part 91.21.

I have a standing offer to anyone that wants to see the text of FAR 91.21 and
FAA Advisory Circular 91.21-1. I can e-mail it to you (it's not that big). I
would post it here for everyone but my cheap reader won't let me import text
files for posting. Maybe someone else can do it.

I have both the cheapo Rat Shack discone and the Scantenna and I can say unequivocally, the $39 (whatever it was) I paid for the Scantenna is by far worth the difference in price. If you talk to the people at Grove, they'll tell you to buy their less expensive Scantenna over their discone. I'm inclined to believe them when they say the discone is the better choice if you're also interested in transmitting.

WNYX420 is licensed for 40 portables each on
457.5875 and 461.725 to Albertsons, Inc of Ada, Idaho.

I have the latitude and longitude of licenses but didn't run
the RadioMap(TM) process to see what street they are on.

>What are these things used for anyway? ....
>
>myles KG5AI

I live in IL and don't know how those licensees are used in your
area. Stores here often use these freqs for portable inventory
transmitters, in-store intercoms/phone patches, security, etc.
Fast food restaurants here use them for drive up windows.

Antenna systems for scanning.
by Mike Diaz
```

There have been many questions regarding how to select an antenna for scanning. This is a Readers' Digest version of antennas, meant to give new users some idea of the different antennas and their good and bad points. At the end, I give some specific recommendations on how to build a general purpose VHF/UHF antenna system. This is not an all inclusive book on antennas, but rather a guide for novices in their quest to learn more about their scanning hobby. What's the best antenna? There would seem to be as many different answers, as there are people asking the question. Everybody has a favorite band that they listen to, and different antennas work better on different frequencies. But the fact is, the general principles remain the same for everybody. The object of an antenna SYSTEM, is to deliver as much signal as possible to the antenna jack on the back of the radio at the frequency you're listening to. Notice I wrote system; the antenna is a system comprised of several parts: the antenna, the lead-in cable, and the mast or tower to hold it up.

1) ANTENNAS
There are MANY different and very good antennas on the market. There are also some bad ones out there. Antennas are where the most compromises must be made. If you have unlimited room , and very deep pockets, you can put up an antenna farm with a different antenna and radio for each band that you listen to, and not have to compromise. But if you're like the rest of us, you WILL compromise. If you only listen to one band, then your best bet is an antenna designed specifically for that band. Something like a 1/4 wave ground plane, or a 1/2 wave dipole antenna is a good choice

for omni-directional listening at a low cost. It will have the added benefit of being less efficient out of band, which if you live in a dense signal environment, may attenuate those out-of-band intermod producing signals somewhat.

1/4 WAVE GROUND PLANE antenna
This is a single band vertically polarized antenna that offers about 3dB of gain in a relatively narrow frequency range. Its major benefits are its low cost and small size. The ground plane isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the radially mounted elements around the bottom. A car mounted antenna is typically a 1/4 wave that uses the body of the car for its ground plane. There are some versions that have several vertical elements (like the R.S. "Allband" with 3) but each vertical element will only be resonant in one band. While it will receive signals in all bands , it will only be efficient in the 3 bands that the vertical elements are cut to resonate at. Radio Shack's all-band (they used to call it a tri-band) is a good antenna if you have a limited number of bands you listen to. It's reasonably priced and gives good performance on 3 popular frequency bands and is usable on the other bands as well, and best of all it is inexpensive.

DISCONE antenna
This is a relative of the 1/4 wave ground plane antenna optimized for wide frequency bandwidth. It offers 0dB of gain, on frequencies from about 120-1300MHz, and with a vertical element on top, it is usable down to about 30MHz. Gain is achieved by compressing the radiation pattern into a donut shape with little of the signal radiating upwards or downwards, concentrating the pattern perpendicular to the vertical axis of the antenna. It's called a discone because it is comprised of two parts, the disc, a group of elements parallel to the ground around the top, and the cone, the diagonal radial elements around the bottom. These could be made from a solid metal disc and a cone shaped sheet metal radial, and perform the same, but the wind loading would be increased. The Diamond D130J and the Sigma SE1300 are good discones for general purpose scanning. My personal experience with the Radio Shack discone antenna at home, has shown that it is not a very good implementation of the discone design, and should be avoided. It is too fragile and does not work below 100MHz. I believe that the discone is the best all band antenna, it really works. I don't see ANY other type of omni-directional antenna usable for TRANSMITTING on ALL VHF and UHF ham bands (50, 144, 220, 432, 900, & 1200 MHz) like the discone is. It would be usable on all frequencies in between too, but that's illegal, if you're transmitting as an amateur. I have built many UHF data and voice links (among other things) for the US Gov't over the years and we use discone antennas for the 225-400MHz military UHF band; the VSWR is consistent and low across the entire band.

1/2 WAVE DIPOLE antenna
This is also a single band antenna that offers 2dB of gain in a relatively narrow frequency range. The dipole antenna is the standard against which

gain is measured on all antennas, and it is twice as long as a 1/4 wave antenna. It has balanced signal and ground sides, which means that the coax feed is in the center of the antenna. The center conductor is hooked to the top half and the shield connects to the lower half. It requires a balun to connect it to coax cable, although there are feed techniques that can do the job of matching the antenna to the 50 ohm coax. It is fairly large for the frequency it's tuned to, and like the ground plane antenna, it isolates your antenna from having to be coupled to earth ground at a specific multiple of the wavelength, by simulating ground with the lower half of the antenna. The dipole can be oriented either vertically or horizontally.

YAGI beam antenna
Named after it's inventors Mr Yagi and Mr Uda (the second guy always loses out, and I forget their first names), theYagi-Uda parasitic array is another single band antenna. It offers 10-20dB of gain and 10-30dB of front-to-back isolation in a relatively narrow frequency range. It is a group of dipoles all the same length, connected to a boom, to hold them a specific distance apart. It offers excellent gain, and front-to-back isolation, and a narrow beam width that it will receive from. The gain is determined by how many elements are used as directors, and is achieved by limiting how many directions a signal can be received from. Like a magnifing glass focusing the sun, the smaller the spot the hotter it gets. The most useful feature of a beam antenna, is that the can be rotated to null out a signal you do not want or maximizing the one you do want. You will need a rotor to point it in the right direction; if you want to listen in more than one direction. The down side is, it will only have gain in a narrow frequency range of about +/-1% of the center frequency, which would be beneficial in a dense signal environment to attenuate those intermod producing signals you do not want, or if you only listen on one band. It is most commonly used by commercial and amateur operators, since it is an inexpensive and very efficient type of antenna for single band, point to point, communication in the VHF/UHF range.

LOG PERIODIC beam antenna
The Logarithmicly Periodic Dipole Array is a beam antenna optimized for wide frequency bandwidth. It offers 5-15dB of gain with a moderate 10-15dB of front-to back ratio; the beam width is fairly wide when compared to a Yagi. It is a group of dipoles of decreasing size (with the longest in back and the smallest in front), connected to a boom, to hold them a specific distance apart. The tapering of the elements is what gives it the wide frequency range, by always providing an element that resonates near the frequency that your operating on. It is most commonly used in TV antennas, where operation on many frequencies is required. The down side is that the LPDA can be fairly large for a VHF/UHF antenna. There are commercial versions available that provide general coverage. Create Labs makes two models for $200-350. EEB and Ham Radio Outlet both have them in their catalogs.

TV antennas
A TV antenna is NOT a very good scanner antenna because it is optimized only for the TV bands. If you look closely at a TV antenna you will notice that the taper of the elements is not uniform. There will be several long ones (Chan 2-6 at 54-88MHz) then several medium long ones, usually interspersed with the long ones (Chan 7-13 at 175-216MHz), and then a bunch of short ones, all the same length (UHF 470-812MHz). The missing elements are for the frequencies that a scanner user wants, but are not in the TV band, so they are not included in the design. If the frequencies that you do listen to are close to the TV bands, then after re-orienting a TV antenna to vertical polarization, it may work, but I'll bet it doesn't work very well. Another problem is, the UHF elements on a TV antenna are ALWAYS a Yagi design. The reception range that they advertise is only on one channel (my guess is around Chan 35 at 600MHz) and the gain falls off the farther you get from that center channel. There are no scanner type signals anywhere near this frequency and a Yagi is a tuned frequency antenna. You will NEVER see a gain Vs frequency plot of any TV antenna from the manufacturer. This is why TV antennas make lousy scanner antennas. If you want to use a wide band UHF TV antenna, try a 4-bay bow tie, it has about 6dB of gain, a 15dB front-to-back ratio and resonates across a wide frequency range. The whole antenna just needs to be re-oriented to vertical polarization. On VHF, don't bother. I am not aware of any true broad band LPDA TV antenna, they are always optimized only for TV frequencies, due to the lack of elements resonating in the 88-175MHz and 216-470MHz bands.

2) Lead-in CABLE
It doesn't matter how good your antenna is, if you are feeding it with lossy COAX.
The loss that a COAX has, is determined by many factors, most having to do with the density and effectiveness of the shield and the dielectric (the insulator in the center). If the shield is not very good, more of the signal will be lost before it gets to your radio, and you will be susceptible to multipath distortion in strong signal environments. If the dielectric is made wrong, the impedance of the COAX will vary. The problem is the quality of the cable itself, this is something that you can't see or discern from the specs, RG-8 is RG-8 right? WRONG, because it is a manufacturing process, if the machines that manufacture it are not set-up properly, or the materials used are sub-standard, the result will be BAD COAX. Cheap COAX may have a 98% shield in it's specs but it won't be consistent across the entire length of the cable. Sometimes there will be areas several feet long with large gaps with only a few strands in the shield. There is no way to tell from outside the cable that something is wrong, without using an expensive network analyzer setup. The same for the dielectric, if it's uneven, the characteristic impedance of the COAX will vary tremendously. The result is you just won't hear as many signals at the higher frequencies. That is why you should always buy name brand cable from a reputable manufacturer. There is a reason the cable is cheap. Frequency is the other MAJOR contributing factor in determining your losses. The higher the frequency, the higher the loss. If you only listen

to the California Highway Patrol, in the 39-45MHz band, then a VHF 1/4 wave ground plane antenna and any kind of COAX will do, such as RG58, which is easily routed, and not very expensive. The same is true if you listen only to railroads or police/fire in the 150MHz band. A single band 1/4 or 1/2 wave and the better RG8 cable will be plenty good enough. But if you listen to the 800MHz trunked band you can significantly improve your reception, by just using better COAX. I use Heliax on my system for maximum performance. I've included a chart of some common 50 ohm coax and their loss at different frequencies for comparison.
These are from the Belden Wire and Cable catalog, except for the Heliax.

Losses in dB per 100Ft

	50MHz	100MHz	500MHz	900MHz
RG-58A/U	3.3	4.9	13.3	20.0
RG-8/U	1.2	1.8	4.7	6.7
Belden 9913	0.9	1.4	2.9	4.2
1/2" Heliax	0.56	0.83	2.0	2.8

Note: The losses scale proportionally with length. Half as long, half the loss in dB.

3) The MAST or TOWER
There is no substitute for height, until you've cleared the obstructions around your house. After you have cleared any obstructions, more height will give only slightly improved range. Remember line-of-sight won't change much with another 10 or 20 feet of elevation. It takes 100's or 1000's of feet of elevation to really make a difference.
I don't know much about lightning protection, since here is Silicon valley we rarely ever get any lightning, maybe once every 5 years. I saw some just last winter, or was it the winter before. Anyway don't forget to ground your system as appropriate.

My RECOMENDATIONS
I think most of us listen on many different bands, so a single band antenna just won't cut it. A single antenna, with good performance on all bands is the best solution. I personally have chosen a Diamond D130J discone antenna, and I am very pleased with its performance. The Sigma SE1300 has the same performance but costs a little more. I recommend RG8/U or Belden 9913 low loss COAX as your best bet, the 9913 is much more expensive. I got my Heliax, surplus and cheap. I swept it using an HP network analyzer to be sure it was still good. For a mast, no more than 10-20ft above the roof is necessary to clear most obstructions, such as neighbors' houses and trees. More than that will give only a marginal improvement in receiving range and make the installation more difficult and dangerous.

Multiple radios
I've connected all of my radios to one antenna with the use of a 4-way splitter. This is not a cheap R.S. splitter but a commercial quality hybrid type from Mini Circuits with guaranteed specs from 1 to 1000MHz. I

lose 7dB of signal but it's worth it to have only one antenna and cable.
My ICOM 7100 and both PRO2006s all run from the same antenna and I have an extra spigot that I can use for testing my PRO-43 or any other radio.

If you want more in-depth information, try the ARRL Antenna Handbooks (there's one specifically for VHF/UHF) and check your local library.

Jack
youll be sorry. I HAD an R.S. discone on my roof and it's performance is abysmal below 100MHz. Besides that, the elements are very fragile because the hollow elements have a threaded insert on one end so it can be screwed into the antenna. If I ever took down the mast I invariably broke a radial in the process. I gave up on it and bought a Diamond D130J from Grove, it has all solid stainlees hardware and has been on my roof for years with no problems at all.. I have been very pleased with the D130's performance.
I pick up about 20dB more signal at 50MHz over the R.S. discone.
If a mediocre performing and fragile antenna is good enough for you, then go ahead and buy the R.S discone. I sold mine to a friend for $25 (Although he had to buy two radial elements from Tandy parts center to fix it) and it's "Good enough" for his use. He can't put up an antenna outside, so the lack of a vertical element on top allows it to fit inside his mobile home.

Good scannin' to ya.

>to the Air Evac (emergency medical helicopter) in the phoenix, AZ area or a
>similiar service.

Try 155.325 for dispatch and 464.250 for general talk around. Also be sure
that you have Med channels 1 - 10 in the scanner as almost all of ambulance to
hospital traffic is on those channels. (Med channels are 462.950 through
463.175 in .025 steps.)

It's been two years since I have lived in Phx so some of this may have
changed.

Good Luck.
Curt

Message-ID: <3d8edc$1pok@usenetp1.news.prodigy.com>
Source record: 263790

I have two recomendations Radio Shack and Bearcat by Uniden
The Radio Shack sets I find to make better home units and Uniden
makes the better portable. If you live in a urban area the best type
of set should be one with triple conversion so you will hear only the
station you are tuned to, if your in the suburbs then the cheaper dual
conversion sets will probably work just fine.
I currently have a Bearcat 200 portable that I carry around on the job
and
a Radio Shack 2006 for at home. I'm very pleased with both and If you
can
get them in your area I think you will be happy too.

7166. Radio related Internet sites

Newsgroup: rec.radio.scanner
Date: 1994-12-21 09:07:20 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.55.00091F92@ccm.hf.intel.com>
Source record: 263779

I have decided to start compiling a list of radio related Internet sites. Here is the first draft. I have only verified a few of these sites and some of the data may be outdated. Many of the sites are Ham radio related, but I am particularly interested in Scanner sites if you know of any more.

I am interested in additions and updates. I'm sure I'm missing some obvious ones since I just threw this list together yesterday. Please remember that just because you can not access a particular site, doesn't mean it doesn't exist any more. It may just be down temporarily.

Please don't ask me how to access www, gopher, sites etc. If you do not know how to use these services, there are other newsgroups dedicated to helping people with these things.

Radio Related Internet Sites

Well I took the plunge and ordered the aor 8000 from Javiation. Now
I have to worry about paying for it without the wife knowing...:-)
So...I am selling a couple of older scanners to get a start...

Bearcat 250 /with manual (I'm the original owner and it works great)

Cobra SR-11 handheld. (10 channel programmable, nice little unit but no
aor-8000)

175.00 takes both and I'll ship.

You can get yourself a Christmas present too...but think about the
consequences if your wife finds out. I have been and the name Bobbit
keeps coming to mind.....:)

Merry Xmas to the nicest newsgroup on the net.........

Somewhere on the back of the unit near the serial plate is a four character code such as "OEHF." Convert the letter to the number of the alphabet (except the "O," so the OEHF in my example would be 0586 or May, 1986.

Dave

I've never heard of anyone failing to import them successfully. Use either Atlantic or Javiation (Canada and UK respectively). You are permitted to legally import up to three non-FCC certified devices per shipment for personal use. If you're concerned about such details as if it can be FCC certified or meets regulations - don't be, since it is imported as a non FCC approved device, it does not need to meet any requirements. That includes frequency limitations or otherwise.

If you do not already know, you can buy the comprehensive "Alberta
Frequency Book" for $20 from any Radio Shack or technical book store.
You can also download the Alberta Frequency Database (ASCII file)
from any Alberta HAM radio BBS. The file name is scanalt8.zip.

7178. AR8000 - Reprogramming the "Auto" settings HOW?

Newsgroup: rec.radio.scanner
Date: 1994-12-21 19:55:49 UTC
From: michael.ayotte@netcom.com
Message-ID: <michael.ayotte-2112941155490001@rsg-av.com>
Source record: 263801

I have had the European version of the AR8000 and the interface for about 5 days now, and would like to reprogram the Step and Modulation defaults but I am not sure how. I know how to manual overide them but I would prefer to actually change the defaults. Also what are the step and modulation defaults for the US.

I got the following from my Pro-2004 Manual. I am sure the step size is not the channel spacing but some devision of it. I welcome any all comments.

25 - 29.995 AM 5kHz
30 - 87.995 NFM 5kHz
87.5 - 107.995 WFM 50kHz (I know FM broadcast is 200k channel spacing)
108 - 135.995 AM 12.5kHz
136 - 224.995 NFM 5kHz
225 - 520 NFM 12.5kHz
520 - 760 ??? ??? (any Ideas)
760 - 823.995 NFM 12.5kHz
824 - 845 ?? ??? (30kHz channel Spacing)
845 - 869 NFM 12.5kHz
869 - 890 ?? ??? (30kHz channel Spacing)
890 - 1300 NFM 12.5kHz

P.S. Have any Mac Users out there started to write any scripts for the AR8000 with the interface? I can't get Microphone II to even talk to the interface, Sitcomm worked flawlessly but I'm not that good at applescripts. Right now I am just writting my Channel information in MS.Word and pasting it to the terminal Window. Any better ideas?

What a major crock o' SH**. That's just what the Airlines want you to
believe, just so they can maintain control
over what you can or cannot do on their craft. What happens when United
flight 164 flies within 5000 ' of the Sears Tower
in Chicago, pumping out MILLIONS of watts of RF on everything from
Channel 2 TV thru Pagers (blecchhh! messy Rf!!!) to
microwave??? You gotta be nuts if you think turning on your BEarcat is
gunna hurt their navcom.

****
Kids need the darndest things... like a little bit of YOUR blood to

: understand the code names for the different officers. When a dispatcher
: says 6 Frank 3 10-21 Mr. Doe....etc.. What does 6 Frank 3 stand for? I
: know that Frank is like a day time officer (this probably varies according
: to location) but what does the 6 and the 3 stand for. The 6 never changes
: from officer to officer but the other number does. There are 6 Frank 1, 6
: Frank 2, 6 Frank 3, etc all the way to about 6 Frank 12.

In Sonoma County CA, the cops use standard identifiers so that they can
be on the same channel and understand who is talking. The first
number in the ID is the city, where 6 is Santa Rosa, 10 is county
Sheriff, 4 is Rohnert Park, etc.

The second digit is the beat or shift or type of unit. SO uses Frank=
evening shift patrol, Sam=sergeant, etc.

And the third digit is just the officer's ID.

The county fire agencies have a similar system using four digit
numerical IDs to identify the unit, the agency, and the typeof
equipment, ie 7183 is Santa Rosa engine 3, a Type 1 (urban) engine.

A friend of mine gave me his R.S. dicone because it diden't work for
him. I mounted it under another antenna (Mon 58) and the reception was
great. UNTIL I removed the Mon 58, I coulden't pick up half of what I
use to with just the discone. I think I've created some kind of ground
plane antenna by mounting the discone under the Mon 58.

THE R.S. DISCONE BY ITS SELF IS JUNK

Neil

Disclaimer: my experience, my opinion.

D
could with just the discone on my roof

7185. garbage BC200XLT

Newsgroup: rec.radio.scanner
Date: 1994-12-21 22:40:03 UTC
From: dfisher@chat.carleton.ca
Message-ID: <D16Mys.Jnp@cunews.carleton.ca>
Source record: 263789

I have a BC200XLT which is the worst scanner I have ever owned. After a lot of hype I decided to buy myself one a couple of years ago. The reception is terrible, it picks up tons of intermod and the antenna wire has developed a cold solder joint at least 3 times causing absolutelly abismal reception for a few days before I realized the problem. The cold solder joint apparently occoured because of the vibration of being in the car. So after many trips to the radio store to have it repaired and complain about my problems I have finally come to the conclusion that the BC200XLT is a piece of junk. Convince me otherwise!!! In the meantime I will continue to use my RS Pro43 which has excellent reception and very little Intermod. Please give me your opinion!!

I was looking at a catalog with a CTCSS encoder/decoder. I see
a (maybe) 28 or 40 pin DIP on the board and a few passive parts -
that's all.
1) Who makes a CTCSS chip?
2) What's the part number?

The Jan 95 AmSoft CD-ROM will be shipping December 23, 1994.
Cost is $39 plus shipping $3 USA, $5 Foreign. Over 20,000
files for amateur radio. Plus the CALLSIGN call book, and
AMCALL the new logbook from AmSoft that will auto log from
the CD for you. Over 1,350 Radio Mods. The latest HST images.
Over 700 Megabytes of Amateur Radio Software packed into 1 CD.

Version 4.0 Callsign will search for US & Foreign amateurs by
CALL or partial CALL
LAST NAME, FIRST NAME, or partial NAME
STATE, CITY or partial CITY
ZIP CODE or partial ZIP CODE
Create Avery label mailing lists
Create QSL address labels
When used with AmCall Logbook, will create your QSl contact information labels.

Help locate lost & missing children too. The complete list of
1,100 .gif images from the Heidi Search Center is constantly
maintained with up to the minute changes shown on the WWW at
http://www.halcyon.com./alt.missing-kids.gifs

This CD is published every 4 months without delay every JANUARY, MAY, & SEPTEMBER.

If you would like to know what others think about the AmSoft CD-ROM then read what
the authors of Amatuer Radio & Electronics magazines are writing:

Well for the price it's just the best around. It's cell restorable too.
I just can't afford an AOR1000 or things like that. For a casual
scanninst(like myself) it offers everything I need. It is a little noisy
and picks up intermod alot but for $189.00 I couldn't really get anything
else. Anyone have a AOR1000 they want to donate??

i am about to buy my first ham set. i read "all about ham radio" by harry helms aa6fw, and i'm about to take my tech class test.

here's my question: what freqs do cell phones use? are there any mobile hams that can receive in those freqs? i understand that scanners are now blocked out of those freqs. are some still available which can be modified for this? are there hams which can be modified for this?

obviously, i understand that this is illegal in the united states; i would only posess such equipment in countries where it is legal, such as canada and mexico.

thanks,

e

7192. Pro 43 mod help needed

The 200XLT isn't suited for city life, due to intermod, whereas the PRO-43 is.
The PRO-43 is the *only* scanner less than $400 with triple conversion.
Supposedly the 200XLT is more sensitive than the PRO-43, so you could
say the 200XLT is better suited for a small town, and the PRO-43 wins hands
down in large cities.

Also the 200XLT has the wrong freq. spacing when restoring cellular,
whereas the PRO-43 has the correct 30khz spacing when restored cellular.

I picked up a used PRO-43 at a pawn shop for $175 !!! I like it.

I've had a BC200XLT for a couple of years now, and it's served me fine. Of course I haven't used manyu other scanners so I don't have a lot to compare it with, but I like it, and I guess that's all that really matters. I'd recommend it.

Here's the modification instructions for the BC200XLT scanner,
good luck!

-Ryan
==========
The following was received from Grove Enterprises with my friend's
BC200XLT.

.....

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. The modification will void your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.

2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.

3. Carefully pry the bottom of the rear cover from the radio and remove the cover.

4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.

5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (surface-mount type) leadless resistor positioned above the letters "DEN" on the IC.

6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration. This may sound too simple, but yes, that's all there is to it.

REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly (see step 7).

Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds, the frequency 845.000 should appear on the display.

Cut this resistor

The new, lower cost Radio Shack PRO-62 portable uses up conversion and
is triple conversion, too. I found it a little better than
the PRO-43 in handling strong signals although both models
are very good in this regard.

It doesn't cover military air nor the cellular bands.

PS - Except for receiving images and being difficult to conceal,
the Uniden/Bearcat 200xlt is a great radio. It has better audio, a
larger and better lit display, and a more solid case than
the Shack PRO-43. The PRO-43 battery system is more flexible
because it can be powered by ordinary AA alkaline cells.

If you get at least one of each model, the question of which one
to buy is rendered moot :-)

> for this? are there hams which can be modified for this?

Unfortunately, since most amateur radios can scan, they are covered by ECPA,
too.

Can't help you with mobiles. Most companies had HTs that could be modified for
extended receive and you may find some still on the shelves. Some require
hardware mods (Yaesu, Alinco?, Kenwood?); some have software mods (Standard,
Icom). Some (e.g., Yaesu) have only 12.5kHz steps in the forbidden zone;
others (e.g., Standard) have a step size that is a factor of 30kHz, such as
10kHz; others (e.g, Icom) have a true 30kHz step. Out-of-band reception
has a reputation for being awful with the supplied antenna, but my Standard
558A with its antenna is just as good as my PRO-43 with its antenna.

Otherwise, HTs make lousy scanners, but they can do quite well it you want
to monitor one or two channels.

I have very good reception with an RS Discone. Mounted on the chimney,
fed with 85' of RG6 with 2 adaptors at each end and an attenuator switch
box. It gets low band-CHP ok, Cordless phones for 5 blocks. VHF is it's
prime, I get SF Bay area (120 miles away) and a McDonalds' that's 7
miles away.
UHF range is about 20 miles over the mountains, 50 miles over the water.
800 range is about the same as UHF.
I often need to kick in 10-20db of the attenuator to shut up a sheriffs'
department that is 120 miles away and is on the same frequency as a
local PD.
Next experiment is to build or buy an antenna to point toward Oakland
CA, they used to be a favorite to monitor when they were on VHF, but
they went to a trunked 800 system, and I was interested in trying to
monitor a trunked system.

In this area, there are police departments using UW (utility company) frequencies for police purposes. Those frequencies are not shown in Police Call.

Three cities using those frequencies are Berkley, Clawson and Royal Oak, MI. Berkley uses a UW class frequency as its main channel. Clawson uses it as a secondary.

I just happened to stumble across these channels while mapping out what the utility companies in my area were using.

7213. KY Scanner Law

Newsgroup: rec.radio.scanner
Date: 1994-12-22 13:16:38 UTC
From: fa419@cleveland.Freenet.Edu
Message-ID: <3dbu7m$i40@usenet.INS.CWRU.Edu>
Source record: 263818

I've read on the Net and in current scanner books the following:

In Kentucky:

1. The ordinary citizen is not allowed to have a scanner it his/her car.

2. Ham Radio operators are not exempt from this rule.

3. Police may be able to destroy a scanner found in a car on the spot. (Net)

I looked up the Kentucky statute and what I found seems to cleary debunk numbers 2 and 3 from above. If someone has another statute (Is that how you spell it?) to reference or anything else pertaining I'd like to hear it but,

KRS 432.570 part (4) sez:

(4) Nothing contained in this section shall prohibit the possession of a radio by:
a) An individual who is a retailer or wholesaler and in the ordinary course of his bussiness offers such radios for sale or resale:
b) A commercial or educational radio or television station, licensed by the FCC, at it's place of business; or
c) An individual who possesses such a radio, provided it is capable of receiving radio transmissions only and is not capable of sending or transmitting radio messages, at his place of residence; licensed commercial auto towing trucks; newspaper reporters and photographers; disaster and emergency services personnel authorized in writing by the state director of disaster and emergency service (for state personnel) or chief executive of the city or county (for their respective personnel); a person holding a valid license issued by the FCC in the amateur radio service;...

I seems clear to me that an ordinary citizen cannot have a scanner in their car, but a Ham radio operator is exempt. Also, concering the possibility of Police destroying scanners, (*without quoting directly*) part 3 of this section says that it'
(*darn! :) *) it's the duty of law enforcement to seize scanners in violation of the section, but that it's up to the courts to "destroy, forfeit, or escheat (take)" the scanner.

(*One interesting note: After the section there is an area of "Notes on decisions and opinions which contains:
"OAG 89-11 A tape recording of police radio transmissions on a given frequency, is a public record."

Any opinions as to the practical meaning of this?*)

Mike

7214. Scanning on aircraft

Newsgroup: rec.radio.scanner
Date: 1994-12-22 13:33:46 UTC
From: garyg@wimsey.com
Message-ID: <19941222.3F9338.C7B1@wimsey.com>
Source record: 263833

After seeing many postings about this subject, I am adding something for all to consider in relation to the following that was extracted from Yet Another Followup (YAF?).

> >NE>>> I find it hard to believe considering:
> >NE>>> - Scanners do not transmit and the amount of RF that they
> >NE>>> could emit is regulated to pass FCC regulations before
> >NE>>> product release

The above is true in all cases when the scanner is preforming as it was designed to do.

For safety of all when flying, the regulations are also considering that there could be unintentional transmissions from any device that can generate r.f. energy especially in the aircraft operations band.

Follow this example - I recently got a new AR8000 scanner which I am very happy with. There is one problem I encountered which I assumed was being caused by an image from something at the nearby airport (YVR). The "image" was clobbering one of the local police frequencies (143.685 Mhz) and of course, when it happened, scanning stopped. So my answer to this was to skip this channel most of the time.

Last week, I went to talk to the people where I purchased the scanner and decided to check this frequency with another scanner. It had no interference yet mine did. I then tried another AR8000 (luckily there was actually one in the showcase) and it had no interference either.

I then moved mine closer to the other scanners and when it got within a foot or so of the others, the other scanners broke squelch. We did some checking and found my AR8000 was actually transmitting a weak signal. The signal started as soon as my scanner was turned on so I'm assuming it's probably associated with the computer rather than with the scanner section of the radio.

So here's a case of a new scanner type which passed all the f.c.c. qualifications but, because of a fault, is generating interference. It is entirely possible there could be signals generated in the aircraft band also (in the range of 108-130 Mhz).

For those who feel it's their right to ignore the air regulations and use their scanners whenever they wish, just consider the fact that given the right conditions, their scanner CAN transmit. Yes, the odds are that it isn't transmitting (right now) but do we need to change flight safety odds unnecessarily?

By the way, the Canadian distributor is going to exchange scanners
for me when they get more in stock.

I had Pro-Phone for a night and found most data is 5 years old or older. I called and was told to hang in there, the 94 edition was about 50% accurate. I asked if it was worth a 50% discount, we went back and forth and she told me if I was that un-happy to take it back. I did the next morning and the store said they had many returned to them. I now use 70 million households and 11 million business's by American Business Information. Each are under $30 and are far more accurate than the trying to get money from customers to develop the software deal.

Pro Phone is one of the worst products I have seen. Not only are the listings old, frequently only the female member of the household is listed. Unless you know her name, you won't find the listing. I discussed all this with the publisher and I got the same "if you don't like it, you can return it" attitude. They did indicate the listings are provided by a firm which handles addresses for bulk mailings. I guess there is no correlation with the phone directories.

PhoneDisk, by American Business Information, is so much better. It is more complete (not 100%, however), and more accurate. There are several models, depending on your use. The top of the line is the reverse listing which permits you to search on name, address, phone number, and you can even go up and down the street from a given address to see who lives in all your neighbors houses. I have this set and I am pleased with it. In addition, you can search by type of business and location. Thus, if you want all the McDonalds in Dayton, it will do it. You can find all the McDonalds in the US if you want a lot of reading. It will list all restaurants in a given location, too. (or any other business type).

Watch for slightly outdated versions at drastic reduction in price. The current model runs $150 to $250. One which is up to a year old still has much info which is still current and can be had for around $50 or whatever the seller wants. Also watch for date of issue if you are paying top dollar to be sure you get the current one. ABI sells direct.

You might wonder what this thread is doing in a scanner newsgroup,
but the phone directory CDROMs are helpful in identifying the
stations you hear and clarifying entries in the FCC license database.

If you hear someone mention a telephone number or address over the air,
you can look it up.

I found some state prisons and correctional facilities our
local expert didn't know about. You can find lots of entries
for Federal Bureau of Inv..., etc.

Milt Forsberg <miltf@ux1.cso.uiuc.edu> wrote:

>....
>PhoneDisk, by American Business Information, is so much better.

I think you made a typo.

PhoneDisc CDROMs are made by DDA (Digital Directory Assistance).
The 11 Million Businesses and 70 bazillion Households mumble CDROMs
are made by ABI.

I've owned both these CDROMs *as well as* ProPhone and
recommend DDA's PhoneDisc products over the others. I have DDA's
latest Phone Disc Power Finder which is fully reverse indexed.
It contains men and women. Many of the women listed aren't
even found in your local paper telephone directory (e.g.,
my wife and sister-in-law). It has both a DOS interface
and a brand new Windows interface with which I'm delighted.

On the other hand, I was *really disappointed* with the ABI 11 Million
mumble disk, which was cumbersome to use, full of restrictions,
limits, and warnings.

I'm not an owner myself, but people I've spoken to say it uses the FM radio
range (data are broadcast on the subcarrier (if that's the right term) of
a local FM station). It's the same method that non-wireline Muzak and
read-books-for-the-deaf services use.

>The watch and its services has been operational for some time in the
>Seattle area and is just now being activated in the Los Angeles area.

Seattle and Portland were the first markets. I think they're expanding
elsewhere too.

>I'd be interested to hear from folks in Seattle how well the MessageWatch
>works......it seems like a clever idea....

You forgot to mention that they also broadcast time synch every six minutes
or so (which works even if you don't subscribe to the pager service).
Having seen the watch, I definitely prefer other solutions (like PCMCIA
pagers for palmtop/notebook computers) since the watch's screen is VERY
small and the service can't be used anywhere but the city you're in.

>>KD6ELA / GROL PG10-25691 / Pvt. Pilot ASEL

Maybe Someone should come up with a FAQ on this subject, as there seems to be
a lot of potentially dead scanner users regarding this subject!.

If you don't know how your rcvr works, you are not a radio/scanner hobbiest,
you are simply an eavsdropper with a potentially dangerous toy!

Unless you understand how and why a radio works, and you are completely versed
on Federal Air and Federal Communications Rules and regs, Don't assume
anything concerning RFI and the operations of Aircraft systems. What you
don't know can kill you and maybe a few hundred other people with the
misfortune of being on the same flight.

Just because you don't understand it does not make it safe!

Curtis has half the answer with the FAR. But the real answer is in becoming
educated about these toys we are all so fond of.

:)

7225. FCC databsae codes

Newsgroup: rec.radio.scanner
Date: 1994-12-22 19:16:23 UTC
From: af631@detroit.freenet.org
Message-ID: <3dcja7$nte@detroit.freenet.org>
Source record: 263829

Recently I obtained an FCC DB file for my area, it seems to be "faiirly" accurate. The codes in the SVC, TYPE and EMISSIONS columns are greek to me. Is there a way to figure out these codes ? Here is an example of what I am trying to figure out.

SVC = PP
TYPE = FB2
EMISSIONS = 20KDF3E

Any help would be great.
Thanks in advance
Dennis

7226. Re: BC2500XLT Celular Restore Date OGID?

7238. Pro-39 outperforming a Pro-43

Newsgroup: rec.radio.scanner
Date: 1994-12-23 01:32:32 UTC
From: dvoelker@leland.Stanford.EDU
Message-ID: <3dd9bg$b2@nntp.Stanford.EDU>
Source record: 263843
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Is there any reason a modified Pro-39 should outperform an
unmodified Pro-43 in a frequency range that both can receive (851-869)?
Placed right next to each other, the 39 picks up 5 to 10 times as many
signals as the 43. Could the 869-896 restoration have enhanced the 39's
reception of frequencies outside that range? Or is the 43 (just bought)
a dud? Date code on the 39 is 2A4; the 43 is 4A3.

7239. Barksdale AFB Frequency Problems

Newsgroup: rec.radio.scanner
Date: 1994-12-23 01:59:29 UTC
From: wwhitby@aol.com
Message-ID: <3ddau1$30q@newsbf02.news.aol.com>
Source record: 263853

Last weekend I drove to Barksdale AFB, Louisana to pick up my mother. I took my scanner and punched in all of the listed Security Police and other freqs. I also put in the Air Force trunked channels listed in Monitoring Times. The only frequency that was active was one for maintance. Everything else was silent. I had to stop at the gate to get a pass and I heard the SPs HTs and they were very active.

Something like that has happened at Maxwell AFB in Montgomery, Alabama. What were once active Security Police channels are now dead.

Does anyone have any idea what is going on?

Maybe they've gone to a trunked system. Some federal agencies are now using
trunked systems in the low 400MHz band. Here are some frequencies straight
out of _Police Call_:

Group 1: Group 2: Group 3: Group 4:
406.350 406.750 406.550 406.950
407.150 407.550 407.350 407.750
407.950 408.350 408.150 408.550
408.750 409.150 408.950 409.350
409.550 409.950 409.750 410.150

Not sure that that's why, but it is worth a shot.

The PRO-39 picks up more *images* up there from the blocked out cellular
band. The PRO-43 is working *better* than the PRO-39 because it has
triple conversion vs. double conversion.

The PRO-43 is better because there are legitimate ground transmission in
that area you will here when they are there. The PRO-39 will never hear
them since they are imaged over with nearby cellular transmissions.

Of course, if you have a unmodifiable PRO-43 and you want to hear
cellular, your want the poorer performing PRO-39 with its imaging.

7254. 954.45MHz Sacto, CA, what is it?

Newsgroup: rec.radio.scanner
Date: 1994-12-23 15:37:52 UTC
From: tching@bilge.water.ca.gov
Message-ID: <3deqsg$krd@news.csus.edu>
Source record: 263872

I stumbled on a freq - 954.45MHz that has nothin but "elevator
music". Can someone confirm this. I also get the same 1.97MHz above
but it is weaker and I assume it's just an image from my IF stage.
Hence, I'm not sure that even 954.45 is correct.
There's also another music station about 946.39 (I think) plus
or minus a few 100KHz.

I would have to agree - only technically -

A scanner with a VFO and an internal mixer, does generate RF.
Nonetheless, the RF gnerated is so small and so weak, outside of arms length, it is probably not even measurable except with a laboratory grade piece of test equipment.

For years, YEARS, airlines have steadfastly turned down requests for users to listen on scanners in the cabin. Yet they have allowed these RF noise generators knowns as PCs to be used all the time. Now my PC cranks out the RF in huge amounts and it is allowed onan airplane.

I suspect that the real reason is, they don't want you knowing their business.

For instance - I once sat on an a United Jet at Ohare airport. The pilot wanted to split but the company calculated that the plane was too heavy for the now increasing temperature. The pilot radioed back he re-did the calcs and he knew this baby would fly. The company wasn't convinced and a polite fight ensued over the airwaves!!!!! This was my flight!

I knew the pilot would never take off on a flight he was on - if it was unsafe. So I was comforted, but nonetheless, the other stories one hears at airports!

Listen in on the uHF HT channels of the airlines as well.

I use to use a stereo headphone set for my scanner and everyone thought it was a walkman. Trouble is, it's hard to hear unless you have a window seat, and even then... it's poor.

Be seeing you,
Number 6

Is there a way to identify a Pro-2006 that is capble of the cellular
reception modification without opening it? I am about to buy one here
in Canada. Can I assume all Canadian units can still be modified?

7259. Adding UHF TV audio to BC2500XLT ???

Newsgroup: rec.radio.scanner
Date: 1994-12-23 17:31:18 UTC
From: drew.king@omail.wang.com
Message-ID: <D19y07.MpA@wang.com>
Source record: 263847

I have the bearcat 2500xlt scanner. It does very well except for complete coverage of the TV audio bands. I can receive VHF audio fine, but the scanner blocks UHF. Is there a way to reverse this ???

Also, is it possible to tell from the outside if it is 800MHZ modifiable ??

Please respond to drew.king@omail.wang.com

Thanks.

: Paul don't you think it may be the tighter ssb filter in the Ar8000?
: Too wide in AM , narrow in SSB. Not bad for CW.
: Have you tried listening with an external speaker?

: Personally it dosn't bother me all that much. But then I am used to a variety
: of radios as I am sure you are also.

: Vic ki4je

Vic,

Thanks for your reply. I hadn't thought about the tighter SSB filter.
Maybe that combined with the difference in the audio response of the
speaker is causing what I am describing. No, I haven't tried it on an
external speaker, but now that you brought it up, I will.

Thanks again.

From: guyever@aol.com
Message-ID: <3df82k$8ri@newsbf02.news.aol.com>
Source record: 263877

I've had my AR8000 for about 10 days now and having lots of fun with it. I have ordered interface cable which should be here next week. What I am curious about is the ability of radio to receive a dump of frequencies (single or multiple banks) from the computer, complete with alpha descriptions. I download a list of avaible commands a week or so ago, but don't see any that look like they may do that. Also is the format of the computer banks in ASCII as are the AR3000 programs I've seen. They are easy to edit with a Word Processor or even with the Norton Commander I use. Thanks.

Thats easy, all PRO-2006's are cellular modifiable. No unmodifiable
model has been made. The reason being that the 2006 are being fazed out.

: coated one or the larger traditional cell looking one with coil) make an
: improvement?

Probably the best approach would be to use a diplexer, such as those for
hams to combine two single band transceivers on one dual band antenna.
In your case, you would use it "reversed" to feed one receiver from two
antennas. You need to make sure the diplexer has the frequency
crossover somewhere between 500 and 800 MHz.

Another thing to remember is that garden variety RG-58 cable (50 ohm)
has about 2dB loss for every 10 feet at 800 MHz, so you need to keep
runs to a minimum to avoid burning up all the received signal. The
alternative is to use lower loss coax.

i was down at radio shack today, looking for a scanner, a ham, or both. looking through the catalog, i saw in big lettering things like "COVERS THE 800MHZ BAND". i thought, great, that's the band i want. all of it. for use outside the us, of course.

but then when you read the freqs, of course it only covers some portions of that band, and leaves out some other portions.

the ad should have said "COVERS THE LESS INTERESTING PARTS OF THE 800MHZ BAND".

anyway, i have a question. i am interested in a ham radio which has (or is modifiable to have) the following stuff on it:

* full coverage from about high vhf to 1ghz.

* fm and am on all ranges (ssb would be really nice)

* some way of doing computer control

* hand held

does such a thing exist?

thanks,

e

FCC will not allow the sell of any new scanner that coveres the cellular range. The radio above does cover the 800MHz range just not all of it. 800MHz is still a selling point as not all radios cover it at all.

>the ad should have said "COVERS THE LESS INTERESTING PARTS OF THE 800MHZ

Yegh, that would sure sell the radio :-)

>anyway, i have a question. i am interested in a ham radio which has (or is
>modifiable to have) the following stuff on it:

Well If you want continuos coverage that means one of three things. One, buy a used radio thats was manufactured before the Cellular regulations went into affect, Two buy one that was modified or can be modified to cover those frequencies, three buy a scanner outside of the US that doesnt conform to the FCC regulations.

>* full coverage from about high vhf to 1ghz.

Well how much are you willing to spend? I just spent $800 buying a AR8000 handheld from Jonathan Clough <Clough@javiaton.demon.co.uk> with the computer interface. It coveres 500kHz-1300MHz I believe. I am very happy with it. I just wish the computer interface language were a little more intuitive. But no matter.

Hope this info helps.

Guy the answer to your question is yes the basic AR8000 computer dump
is in fairly easy to read ascii. I have used MSWord, notepad,
IBM's EPM and E from O$/2 Warp to edit the data and send it back.

I have written a number of primitive scripts to read 'raw data'
and format it to program a bank using Procomm Plus for Windows.
I was working on one with a great gui interface when
my Percomm CD came and I stopped to figure out how to
hack it. Bob Parnass gave me a great tip that I have expanded
on. Now I hope to be able to have a script that takes the
data extracted from the CD and allows you to tag it for
sending to the AR8000 and then programs it in one stroke.

Here is one of them for you to hack...

```
; Bulk memory programing for AR8000
; requires datafile with frequencies and alpha tags
; only first seven characters of tag will be used
; format of each line is expected to be freq tab text, for example....
; 154.190 Atl. Fire Dispatch
; yields command
; MXA00 MP0 RF154.190 ST1.0 MD1 AT0 TMATL. Fi

; Vic Healey ki4je Dec.16, 1994
; Procomm plus Aspic script

string szLine ; Line from file.
integer count=0

if sdlginput "AR8000 Data File Name" "Name:" szName
if isfile szName ; Make sure file exists.
```

```
if fopen 0 szName READ ; Open file for read.
while not feof 0 ; Loop to end of file.
fgets 0 szLine ; Get line from file.
;transmit szLine
call make_and_send_freq with szline, count
count =count + 1

endwhile
fclose 0 ; Close the file.
transmit "MA^M" ; Dump entire bank to screen for review

endif
else
errormsg "AR8000 data file doesn't exist."
endif
endif
endproc

proc make_and_send_freq

param string szline
param integer count
integer linesize

Michael,
I appreciate your reply. That is exactly what I wanted to find out. I
use Word for Windows, but it should be the same as on your Mac. I wanted

to go ahead and set up my banks so I can download them to the AR8000 when I receive the cable. Figure by the time I get the cable I can pretty well have all the banks set up for the AR8000 . I think your bank organization is good ,however, since I also monitor military air and there are so many different municiplities in the area, I'll have to organize mine a little differently. I have in mind organizing mine a little differently ie. at home (used as base station) bank xx railroad, bankxy civil air, bank xz public safety, etc. On the road I would want to include various Highway Patrol freqs as well as CB (ugh). Around town the setup would be slightly different. Anyway I'm sure you get the idea. Happy Holiday wishes for you and your family.

Thanks,
Guy KC4NQU

YAESU 9600 FOR SALE IN MINT CONDITION

THIS 9600 HAS BEEN MODIFIED & IMPROVED BY EEB. IT IS AN ALL MODE HF/VHF/UHF DC-905 MHZ COMMUNICATIONS RECEIVER, WITH AN INTERNAL CONVERTER FOR DC-60 MHZ. TRIPLE CONVERSION AMN AMW FMN FMW LSB & USB. IN PARTICULAR, THIS RADIO HAS EXCEPTIONAL SENSITIVITY IN THE CELLULAR BAND, AND IS SMALL & LIGHTWEIGHT. 100 MEMORIES IN 10 SCAN BANKS. THIS UNIT NOT ONLY RECEIVES STANDARD FM & TV, INCLUDING SOME CABLE TV. THERE IS ALSO AN OPTION AVAILABLE FROM YAESU (APX. $25./$30.) TO RECEIVE VIDEO FOR OUTPUT TO A TV, AND ACCESSORY KITS AVAILABLE TO EXTEND THE RANGE UP TO 1300 MHZ, AND/OR ADD MORE MEMORY.

THE UNIT INCLUDES THE VHF/UHF WHIP ANTENNA, POWER CABLE, RS-232 SQUELCH DETECT INTERFACE CABLE FOR IBM/COMPATIBLES (EASILY MOD FOR ANY COMPUTER), SCANCAT PRO COMPUTER CONTROL SOFTWARE, MANUALS, & MOBILE MOUNTING BRACKET.

PRICE: $495.00 /MONEY ORDER, CERTIFIED CHECK, OR COD
INCLUDES SHIPPING CONUS

REPLY BY E-MAIL, & INCLUDE PHONE NUMBER FOR PROMPT RESPONSE.

Vic Healey KI4Je replies
:Guy the answer to your question is yes the basic AR8000 computer dump
:is in fairly easy to read ascii. I have used MSWord, notepad,
:IBM's EPM and E from O$/2 Warp to edit the data and send it back.

:I have written a number of primitive scripts to read 'raw data'
:and format it to program a bank using Procomm Plus for Windows.
;I was working on one with a great gui interface when
:my Percomm CD came and I stopped to figure out how to
;hack it. Bob Parnass gave me a great tip that I have expanded
;on. Now I hope to be able to have a script that takes the
;data extracted from the CD and allows you to tag it for
;sending to the AR8000 and then programs it in one stroke.

;Here is one of them for you to hack...

:; Bulk memory programing for AR8000
:; requires datafile with frequencies and alpha tags
:; only first seven characters of tag will be used
:; format of each line is expected to be freq tab text, for example....
:; 154.190 Atl. Fire Dispatch
:; yields command
:; MXA00 MP0 RF154.190 ST1.0 MD1 AT0 TMATL. Fi

```
:; Vic Healey ki4je Dec.16, 1994

Vic,
Appreciate your reply. Haven't used Procomm for several years. Never for Windows. KInd of cut my teeth on the DOS version though and am familar with script files. I think I can probably accomplish my goals using Word for Windows to edit the file. Last time I "talked" to you I had not yet received my AR8000, but have now. Still haven't programmed in those military air ie. Dobbins, etc freqs yet. Can't seem to work up the guts to keep turning that dial for 300+ freqs. Anyway thanks for your reply. Happ Holiday wishes for you and your family.

7279. Hot BC3000XLT info!

Newsgroup: rec.radio.scanner
Date: 1994-12-24 01:16:35 UTC
From: 76703.4224@compuserve.com
Message-ID: <3dfspj$kdp@panix3.panix.com>
Source record: 263890

Received from Jeff Goldman, sysop on CompuServe Hamnet:

==========

The Uniden Bearcat BC3000XLT scanner hasn't arrived from the Philippines yet, but I just got an advanced copy of the manual -all 52 pages of it!- today.

Here are the major points:

1) As with the BC860XLT base, you can't use Data Skip AND Priority during a Scan at the same time. Hitting Priority will disable Data Skip. There is no Priority during Searches.

2) You can search at 300cps in ANY band as long as you're in 5kHz increments. So, to listen in on cell images (not that you'd do this <g>), you can program a Search from 1269-1294MHz in 5kHz increments at 300 steps per second. That's the equivalent of the Pro43's 50cps Search, for instance. Only problem is that even when you're searching in 5kHz increments in the 1200MHz band with the BC2500XLT (and, presumably the BC300XLT) you're still a little off frequency! The Track Tuning stops on 2 neighboring freqs in many cases; it's as if you're off 2.5kHz or so.

3) The Battery Save feature isn't a "battery save" feature at all (like the kind where the unit samples-and-sleeps, as in the Pro43). All it means is that if you are sitting on a channel in Manual mode for over 60 seconds and the squelch doesn't break, the scanner starts to beep to get your attention. To stop the beeping, you toggle the Batt Save button to the other position which is Delay. In other words, if there is a Delay set to that channel (or if the scanner is plugged into the wall) the scanner won't beep. Talk about a STUPID feature.

4) If the scanner stops on a freq during a Search or Scan and sits there for 3 seconds due to an unmodulated carrier/birdie/pager data noise AND if the Data Skip is Off, the scanner will start to beep to tell you that it's hung up on what it thinks is garbage. Another really STUPID feature.

5) Battery time is still only 5 hrs, and the scanner uses the same 600mAh pack that the BC2500XLT used. There is a new leather case that'll be available as an option; it'll look similar to the type available for the BC220XLT/BC120XLT/SC150. Too bad they couldn't get the battery life up to the 12 hrs of the BC220/120/SC150 (especially when they use the optional 800mAh Freq Fan Club battery pack).

6) Channel delay is settable PER CHANNEL, not global!

7) The Attenuator gives 15dB of attenuation and is settable PER CHANNEL, also not global!!

8) The battery clip is the same cheap, awful one that was on the BC2500XLT. That means that you have to take off the clip everytime you want to take off the battery pack.

9) No mention is made of a 25kHz step or the Auto step feature (by hitting the decimal button twice). It's on the back of the brochure, but that doesn't mean anything. The 25kHz step will definitely be available on the upcoming BC9000XLT base.

10) You can lockout up to 50 freqs in the Search mode.

11) The manual verified that there is no VFO, no Hit Counter, and no ability to use Priority during a Search. Plus, no cellular mod, no carry case or extra battery pack included. You do get a Betty Bearcat Freq Starter guide though. :-)

More than anything, the big questions for me are if the audio quality has been improved over the BC2500XLT and if 15dB of attenuation is too much (when you are trying to get rid of intermod). Plus, can you still enable 25kHz steps in the civilian airband?

At one time, Uniden had foldouts for manuals (ie BC200XLT). They've gone full circle and are now publishing a 52 page manual and loading up the scanner itself with stupid warning beeps. Unbelievable. They think that absolute beginners will be buying their new $400 scanner and need to be beeped to death to keep them out of trouble.

Also, make believe that you are listening to cell images (which you'd never do <g>) and notice that there are a lot of times where you have an unmodulated carrier (waiting for the phone connection to be made OR a person is put on hold). Previously, with a Uniden scanner that has Data Skip OR a GRE scanner with Sound Squelch, you'd turn off the Data Skip or Sound Squelch so that the scanner wouldn't sample the dead carrier and then continue onward. NOW, the stupid thing will beep at you until you are forced to manually hit HOLD. Again, unbelievable.

-Jeff, CIS HamNet Scanning Sysop

I don't know if an HT does but Trident sells a few models that do all of
that and go up to 2GHz (cell lock out of course).

7281. Re: BC2500XLT Celular Restore Date OGID?

No, it cannot be restored in a July 1994 (OGID) scanner. Last restorable ones were manufactured in Dec 1993 (OLIC).

: i was down at radio shack today, looking for a scanner, a ham, or both.
: looking through the catalog, i saw in big lettering things like "COVERS THE
: 800MHZ BAND". i thought, great, that's the band i want. all of it. for
: use outside the us, of course.

The rad shack is known for deceptive sales and advertising... so
I have heard :)

: anyway, i have a question. i am interested in a ham radio which has (or is
: modifiable to have) the following stuff on it:

: * full coverage from about high vhf to 1ghz.

: * fm and am on all ranges (ssb would be really nice)

: * some way of doing computer control

: * hand held

: does such a thing exist?

Well, Not quite. You can that kind of thing by spending about
$750 and doing a little modifications and other tricks. This will work
for reception only, and will not be hand held protable. You cna get the
R/S pro2006, install the optoscan 456 board, and then do the 455Khz IF
output jack mod to your scanner, and hook that to the antenna jack of
your hf shortwave receiver. This is what I plan on doing. It is not as
difficult as it sounds.
the 456 is a board that installs into the pro2006, that allows
continuous (almost) coverage with complete pc control, logging, ctcss and
dtmf decoding. Ctcss squelch, and the whole bit. the IF mod allows you
to use the scanner to scan freqs, and your other receiver to pick up AM,
sideband, upper and lower, CW, ect. All ya do is a little solder job,
and a few little things, install a jack, and run a cable to the other
radio.
gotta love it.

: Yep, they still have them in stock, and they are now $285...
: Try lowering the price.
: Dave

That's great. How much does it cost to modify the scanner? Many people can't do this themselves. Add sales tax, and I think I'm reasonable. Besides, I've already got several people interested.

Thanks for your concern.

In addition to the long message about the BC3000XLT, I want to add these notes:

You still can't use Data Skip when in the AM mode.

Data Skip is still ineffective against trunking tones.

You can now search Up OR Down in frequency with the BC3000XLT.

-Jeff

Ok,there are 4.2 million people who want to know if the PRO 2032 can be modified to receive the cell phone frequencies. I too would like this information. The problem seems to be that there is no one answer. I have a date code 2A4 scanner with no orange dot. Older 2032's came native with cell capabilities, I assume. At some point the powers that be took that away. The question is can you go back. And is there an even later revision that makes mods impossible, as has been implemented on many of the other "newer" models? I really do not know, but would greatly appreciate the help from anybody who does. Thanks very much in advance.

:You gotta be nuts if you think turning on your BEarcat is
:gunna hurt their navcom.

I agree. I believe that it's more of a liabitlity issue. Since the radiation therotically COULD interfere, they just say DON'T DO IT...but if you did do it, it probably wouldn't prove determental. However, I probably won't scan my flight coming up....

Likely to be Muzak or another "elevator" service. the freq is a multiple address microwave service channel and is used for program distribution like muzak, stock data etc, and some are used for 2 way telemetry such as water, sewer, oil pipelines etc.

good scanning

7295. Pro-43 in Car

Newsgroup: rec.radio.scanner
Date: 1994-12-24 05:54:17 UTC
From: bdodge@ucsvax.sdsu.edu
Message-ID: <bdodge-2312942154170001@130.191.147.226>
Source record: 263904

I'd like to be able to occasionally install my Pro-43 in my 89 Honda. I know I can get power from the never-used cigarette lighter, but I don't know about the other two necessary connections:

1) What's the best way to mount it so that I can get to the keypad? I'd rather not mess up the visible parts of the dashboard with holes. Is there something that's stable but temporary like a drink-cup holder?

2) The antenna. Can I use a splitter and matching transformer (or something) to make use of the existing AM/FM antenna? I don't expect to do great DXing with this setup... just pick up police calls and perhaps local media folks for entertainment while I drive.

Any pointers to appropriate products will be gratefully read.

I have a PRO-43 that I recently got for graduation. I have checked this group out and it seems that there are other scanners to be had. I have a friend that has the AOR-3000 and he raves about it. I can trade in the PRO-43 for about $285 (the new Radio Shack price). I hear the AOR1500/8000 are great scanners. Could anyone help me with this decision?

Thanks,
Charles

Yep. When I placed the order I asked them *specifically* over and over about removing the cellular lockout, and they assured me there was a mod to do exactly that. What a bunch of BSers.

>My TR-2400 died after about an hour of using it, and I returned it.

Lucky you, mine came with several defects right out of the box. :> Every other 2400 owner i've heard from has said their unit died within the first weeks of using it, so i'm sure mind would have done the same if I kept it.

>By the way, the people at Ace were very pleasant to deal with, and they
>shipped the unit within a couple of days even thought they said it would
>take about 2 weeks.

Hmm... lucky you again, they jerked me around for about a month. Every time I called back I was told it would be sent in x-number of days, but it never was. When I called back for about the forth time after several weeks (naturally rather ticked off), they sent me a defective one right away. Somehow I doubt i'll be buying anything else from this outfit... :>

7303. Need modifiable Pro-43 or Icom R-1

The pro 43 is a formerely great radio and still is for the price.
It has been DISCONTINUED by radio shack an is no longer available except for
store returns and or small town dealers that don't get that much tracffic.
They will sell it to you for $249 if they have one.

The AR8000 is not compareable to anything. It is a great
radio with extensive features that are not found in any
other hand held. It is expensive and complicated.
It can take a awhile to even learn how to use and therefore
isn't especially suited for a newbie to radio and or computers.
If you can afford another $300 and you really are into both
computers and radio then you are doing yourself a disservice
by not looking carefully at the AR8000. More information on the AR8000
is being added to a ftp location for your benefit.
try ftp://ftp.crl.com/users/ro/vhealey/www/ and you will find at least
one file on the AR8000 and others as I get time this weekend to put them there.
html files require a web brower and the pure text form will be zipped.

Eric Hollander (hh@scan.Berkeley.EDU) shaped the electrons to say:

>the ad should have said "COVERS THE LESS INTERESTING PARTS OF THE 800MHZ
>BAND".

But it -doesn't- cover the least interesting portion of the 800MHz band--which
is cellular--as it is illegal for people in the US to do so.

Someday maybe McDonald's across the nation will put in phone-ahead service so
you people can get the most of what turns you on.. "Hi, Honey, I'm on my way
home" -and- "Can I have two quarter pounders with cheese".

I haven't checked recently, but Grove sells or used to sell a holder. I
forget the price--about $15. In any case, you can get a drink holder that
will work just as well for about $5. The other option is to attach velcro
to the unit and the dashboard. Rat Shack sells some "super" velcro; other
places must sell it too. Grove also sells an add on that will allow you to
use the auto antenna. I think it's about $20 (and if that's the case,
that's too high). In any case, Rat Shack sells an antenna extender that
clips on the window. I use that and it works pretty well, except when it
rains! The other thing you might want to consider is a CD-cassette adapter
if you have an auto casssette system. It works a lot better than cranking
up the scanner to get over the road noise.

Hi Bernie,
Call Transel Technologies at 800-829-8321. Order item T64 for $16.95 plus $5 shipping. This is an adapter Y-cord that connects your car radio antenna to both your car radio and your scanner. I have one and it works fine. This model has a BNC plug to connect to your scanner's antenna jack; for a dollar less, model T63 has a Motorola plug. I think you need the BNC model. Also request their free catalog--lots of interesting scanner accessories. ---Dan

i had and owned a bc200xlt for 3 years and loved it (until the day it was stolen). never had much of a problem with it. intermod was about as expected for the unit in san jose california (crappy) but most of the time i wasn't very close to downtown where all the 300 watt paging transmitters were. very rugged radio. every handheld i've used or had before have ALL had cold solder joints develop once in a while (about once every 6 to 9 months) on the antenna connector. i abuse my rigs quite a bit but they all get me the info i want when i want it. i like the pro 43 but it's too nice of a radio and a bit too delicate in my opinion for normal drag and drop use when i'm out and about. i'd love to have a 200 xlt again.

Source record: 263923

Just scan in the 894-916 MHZ range- you will hear the 1st harmonic of your 'blocked' cell band quite well- no mods necessary. This is due to the fact your unit probably has in Intermediate Frequency of 21.4 MHz.

Message-ID: <3di2mg$7en$1@mhadg.production.compuserve.com>
Source record: 263679

Having talked to someone who would "know" about whether there's a mod or not, there is absolutely no cell mod for the Pro62. The Pro62 is, however, a terrific new scanner and has no problem getting cell stuff with the GRE Super Converter.

-Jeff

7324. Basic BC855XLT question

Newsgroup: rec.radio.scanner
Date: 1994-12-24 21:26:06 UTC
From: daver@ux1.cso.uiuc.edu
Message-ID: <3di3le$p6t@vixen.cso.uiuc.edu>
Source record: 263680

Hi all,
My wife (brillant woman who knew I was thinking about buying a scanner) bought me a Uniden/Bearcat 855XLT for Christmas. It was the floor model and didn't come with a manual. I've figured out most things, and am happily scanning Champaign county police and fire stuff as we speak.

Can anybody give me a hand with the limit, search, and hold buttons? In every combination I use search, I get an "error" on the display. Hold doesn't seem to do what I figure it would, which is stop scanning when I hear something I want to stay with.
Limit beeps at me, but doesn't seem to do anything.

Alternatively, does anyone know if I can call Uniden and get a copy of the manual? Or if there is a web or ftp site? Any pointers would be appreciated (including a phone number to call Uniden)

Thanks
David Ruby CCSO University of Illinois - Urbana daver@uiuc.edu

>get 66-88MHz. But, you will have cellular intact... in 12.5kHz steps.

Yes, even the new BC220XLT can be modified.

While it may be true that the cell band cannot easily be restored by
moving a single diode on the microprocessor's input port, there's
almost always a way to obtain expanded capability in a receiver.

1) You can find and exploit a hardware/firmware bug, as I did when I
got the Icom R71A to tune below 100 kHz. (see my article in
April 1985 Monitoring Times.)

2) You can find a design flaw, like using the test frequencies
and the DIRECT key in certain Uniden-manufactured Radio Shack scanners.

3) You can always alter a receiver unless the
circuitry is encapsulated in epoxy. If you feel comfortable
with electronics, I encourage you to buy a service manual,
become acquainted with the circuitry, and *experiment*.

If you still doubt that the latest batch of scanners can be modified,
read Steve Donnell's article in January 1995 RCMA Scanner Journal
on modifying the new Uniden/Bearcat scanners for cell band coverage.
Although I haven't tried his suggestion, it makes sense and is as
easy as cutting a foil and adding a switch in the BC220XLT.

Remember, modifications are almost always possible -- it's just
a matter of someone finding a way to do it, then divulging it.

Miami and Miami Beach use trunking systems in the 800 MHZ range. Miami
using 20 freqs., and Miami Beach using a 10 channel system.. Metro Dade
County is in the process of switching from their VHF freqs to 800 MHZ, and
and this time are using both bands.

It's a 14GHz spread-spectrum uplink to the GTE GSTAR satellite, with
downlink at 12GHz. Data rate is about 165bps... a LOT of terminals share
the same transponder. It's very cool technology... I have one on my
bicycle and am building another into a small boat. Some friends at
Qualcomm did a brilliant hack that replaces the normal OmniTRACS
keyboard/display with a Mac comm toolbox tool, letting Eudora treat it as a
simple POP server.

As to monitoring the spread-spectrum data link... that would be a rather
epic challenge.

From: wn8tdan@aol.com
Message-ID: <3dj218$hmt@newsbf02.news.aol.com>
Source record: 263689

I have had this problem with several BC200's . The Battery has more than just common Nicads inside. The Voltage regulator chargeing parts are also inside the battery pac. I have found an easy way to tell if the battery is bad. Try this. Fully charge the battery overnight. Take a flashlight bulb rated at about 7 Volts and hook it up to the battery terminals. It should light up. If it does not open the case and hook the bulb up to the wires that go directly to the batterys (bypassing the charging unit) If the light glows now the problem is in the very thin wires that are use inside the battery case. Replace these wires (the one connecting the actual batteries to the charging components) If you check the voltage with a meter it does not tell the whole story because it does not draw hardly any current like the bulb. I hope this helps! Dan, WN8T - - let me know.

Jeff don't tell me this scanner was designed in America. If so
we are still in deep dodo. I know it is only half the price
of an AR8000 but you would think you would get at least half
the features of the ultimate handheld.

What is the reasoning of a data skip that beeps. I know long before
four seconds is up that the radio is on a data channel. I would want
a radio that recognizes data BEFORE it opens the SQUELCH.Now that would
be worth something to me.

Don't know about the device you're asking about, but all ya□
got to do is lock out that channel. Next day when they switch
to another control channel lock THAT one out and then
remember to go back to the previously locked out channel
and re-enable it.

This obviously won't help you if your problem is during
search scanning.

Most agencies change their control channel same time each
day, oftentimes at 12 noon.

Good luck!

: Will a PK-232 decode work? How are you doing it?

: Not that anyone would actually do that, it is a "theoretical question".

I use the Universal M400 decoder, it does a nice job when connected to a
parallel to serial converter.

A company by the name of LesComm in Texas was advertising such a device in Monitoring Times. They requested a SASE for information, and I sent one, but never heard back from them. Subsequently, I have not seen any further ads for them.

There is another group called Comsec, which advertises in various pubs. They had an ad for such a bypass device in the RCMA newsletter. I'll post their phone # when I'm at work and can look at the ad.

Likewise, Bill Cheek, the fellow who has written several of the scanner modification handbooks, has detailed such a device, and he may even sell a kit to build one. He can be reached at via CServe at 74107,1176.

Our cities have installed GE/Erickson systems, which have an annoying anti-scanner tone after each transmission. I wasn't aware of Motorola doing that too, but such a device may be of use. I have not personally gotten one installed in my 2006, but I'd like to see this thread continued to hear the response from others who have used these devices. Hope this helps.

73s, Kirk Baxter

I don't know where you can get RCMA Scanner Journal in Canada,
but they are available at 25 stores in the USA, including
EEB, Gateway Electronics, and HRO (Ham Radio Outlet) stores.

The best way is to join RCMA which includes a one year subscription.

From the "Introduction to Scanning" FAQ article:

Last changed: December 16, 1994 |

Introduction to Scanning
by Bob Parnass, AJ9S

[....]

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other
radio buffs. Trading information with other hobbyists
about frequencies, communication systems, and receiving
equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio
Communications Monitoring Association (RCMA). Founded in
1975, the RCMA is the "first national and international
organization of monitor radio listeners." There are
several regional chapters which hold regular meetings.
Club dues are $24.00 per year, which includes the monthly
RCMA Journal, which consists of approximately 95 pages.
Although the focus is on VHF and UHF ranges, there is
coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA
General Manager, P.O. Box 542, Silverado, CA 92676, USA.

From: towhs1lb@ink.org
Message-ID: <3dkrut$8i2@ink3.ink.org>
Source record: 263707

FOR SALE: Radio Shack Pro-51 Scanner (currently modified, but easily unmodified, you'll understand in a minute if you don't already know)

I bought it like 6 months ago for $299, and since then I heard that it was either outright banned (no more being made), the government examined it, or the government is till examining it. I didn't see it in the catalog from a few weeks ago, it looks like they replaced it. The reason for all of this, is a test mode where you can get many otherwise unavailable frequencies (many of the cell. freq's). It's in very good condition, and I still have the box and manual. Being that I am a law abiding citizen, I will gladly get rid of the modification if you are interested. As I said, they were $299 when I bought it, but I was looking for $200, and I guess I'm negotiable on the price. towhs1lb@ink.org

: : :You gotta be nuts if you think turning on your BEarcat is
: : :gunna hurt their navcom.

I disagree with you about the interference possiblities I will give you this scenario the common IF of most scanners and handhelds is 455 khz this same freqency is the if for the VOR/ILS made by collins installed on many commercial aircraft including the CL-60 Challenger . This peice of equipment is used to guide the aircraft to the threshold prior to landing if the aircraft/pilot/runway is Cat III C or Cat II he can leave the autopilot (flight director) engaged to a RVR (runway visual range) of 100 FT if your radio is transmitting its IF (the oscilator does emit some radiation) and you happen to be in a seat close to either the receiver or the antenae (one for Glideslope) (two for Localizer) (one for marker Beacon) and the shielding is not adequate. You could set up a secenario where by the ILS approach could break lock, (it is not likely to give erroneous readings because of the self check) the aircraft could be forced to break the approach or continue the approach with visual reference and no instrument indication. Now I fly quite a bit with my job and I like to operate my radios on board. I fix these aircraft and I am well aware of all the built in protection but I do not have the radios on below 10,000 ft (normal transition height) in landing config and I do not turn on my radios on take off prior to flaps up and coffee up.....
now I think airlines carry things a little far by placing some needless restriction ie Cellular. I carried out an EMI (electro magnetic interference) survey and at no time could we cause a break lock on VHF between 107-117.95 mhz or the DME 1.05 ghz nor using any harmonic tables could we get 860 mhz to come close to any of normal aircraft equipment. Our passengers are now allowed to operate their cell phones prior to take off after ascent ,prior to descent, and after touch down..
I would ask nicely to use the scanner/handheld stress it is similar to a broadcast radio /walkman and see if you can't get permission if not then I would give her the old on/off once I have reached cruising speed. And if you find yourself cut off maybe you can mention that Laptops especially older ones radiate a lot more rf than a scanner ever will...

73's and good dx (line of site)
and if your interested to find out your slant range take the square root of the altitude in feet X 1.23 and you will get the expected range in miles ie. 37,000 should be 236.595 miles....

While the airplane's on the ground - maybe. At 35,000 feet, though, just one cellphone is going to hit an awful lot of cells. I don't think that service providers want that kind of interference.

You can build a Data Tone eliminator board for the 2006 and it will let you hear the data channel for less than a second before moving on. It uses a comparator, sees the voltage level as a steady 5 volts and moves on. Voice transmissions will always vary from 0 to 5 volts at a rapid pace, the digital signal from the computer control will only be 0 or 5 volts. Bill Cheek published this mod in Monitoring Times in August of 1993. You can also lock out that channel and turn it back on and lockout the new data channel when they make the change. My Sheriff seems to change about every 12 hours, but since I have the boards installed in both 2006's it doesn't matter.....Les

^^

Interesting comment. Being illegal has never stopped me, has it stopped anyone reading this posting? I do it all the time, nice source for live entertainment. Personally, I prefer cordless -- sooner or later you can figure out where it's coming from... In any event, the fact is folks are ALWAYS going to listen to cellular calls, and no law or other government action will change that. Fact!

I have a question on the AR8000:

If you program an AR8000 US model from EDCO, or other US dealer (the one's who have the crappy scanner with the two 800 mhz holes!) with a cellular frequency, using the interface, will it take it? Will it scan it? What does it do? Just food for thought (um, yum!)

7355. Price Police

Newsgroup: rec.radio.scanner
Date: 1994-12-26 04:52:38 UTC
From: marcbg@metronet.com
Message-ID: <marcbg-2512942252150001@net51.metronet.com>
Source record: 263713
Cross-posted to: rec.radio.scanner,rec.radio.swap,rec.radio.amateur.misc

I've sold thousands of $$$ worth of equipment on the net, and to date, I've dealt with good, honest folks who are looking for value.

You know, I'm getting a little ticked off at some folks who believe that they are the Price Police, feeling free to make snide remarks, both via Postings and e-mail concering the pricing of people's equipment. I'm not one to flame, but I'm pissed, so are many others of us, and let me explain why.

So, when I post a radio, and the price seems a little high, maybe it's because I'm testing the water - or maybe it's because you're looking for a REAL bargain - or maybe I want to see if there is someone who wants a quality radio at less than retail, but still wants value. Or maybe I'm clueless and really do want feedback!

I posted a radio recently which sells at a street price for over $450 - for $315. It took me two months to sell it because of smartass folks who posted to the newsgroup AND sent me mail with offers like "$175" or posted things like "I can get it for $350" etc etc etc. When I finally sold it, the guy I sold it too was TICKLED with the purchase, realized he saved 30% off the purchase price of a new radio yet still had all the value of buying a new unit. He even called after he received the unit and used it a while to thank me.

What pisses me off to no end is when I get cute little remarks BOTH via e-mail and postings that say things like "Good price - NOT" or "This is priced too high - you are trying to rip people off" or "What's the matter with you" or "Your price is ridiculous" - these are actual snips from actual email messages. I know many of you who sell things on the net have received them also.

Folks, this is a free market. If you have a beef with prices, then write the poster personally (Don't post it to the group) with something like:

"Marc - your price seems a little high. A new radio at XXXX costs only $ZZZ, and I was wondering why your price was so high. Just thought I'd let you know, and anyway, good luck".

That's what I do. A nice polite note. You know what? I've received phone calls thanking me, because the poster didn't have a clue that they were overcharging. But what type of response would I get with "Hey, are you trying to rip people off?" Probably not a good one.

OR, just shut up and save the bandwidth.

In the spirit of the season, I bope that those of you who are members of the Price Police take this to heart. Folks on r.r.swap, scanner, and r.r.a.m. are smart enough to judge for themselves - and if they're not, they can always post a message inquiring what the price of a particular used item should be. And if they're not that bright, well, then they should buy retail and stay out of the Usenet grabble.

If you have nothing better to do than to flame about someone's high prices, I suggest you are spending too much time in front of the CRT.

And to all, a Good Night. . . . .

United is the only airline I'm been on that offers this feature. I think
it can be made available on any United aircraft that is equipped with an
audio system for passengers (many smaller 737's aren't since they are
used for short haul service). Sometimes the pilots forget to turn the ATC
link one. A pleasant request to a flight attendant will sometimes get it
started. Generally ATC is more interesting than the musical pap otherwise
offered.

(Clipped off the rest of this nonsense)

Well, MARC - if you sell thousands of $$$ on the net you are doing it in
the wrong forum. Casual sales are tolerable, but what pisses ME off are
the constant listings by the same names!

> who have the crappy scanner with the two 800 mhz holes!) with a cellular
> frequency, using the interface, will it take it? Will it scan it? What
> does it do? Just food for thought (um, yum!)
>

I suspect there is a small possibility that it will take the
frequency.
I recently was puzzeled at the operation of a few memory channels
which I had programed via the computer. The frequency looked ok,
received ok, but when I shifted it into a VFO it changed. I had
forced it to accept freq with wrong steps. You can't do this when
programing it from manual mode where the frequency is entered into
one of three vfo's first.The AR8000 computer checks first and rejects
the information by correcting the freq to match the step. But you
can't tell it to take a frequency beyond the capability of the radio
so it obviously does some checking before taking data from the
computer.

For the time being I have changed my script to set the step at .5 KHZ
(0.0005 MHZ) when sending a variety of data to the AR8000 as I can't
be bothered to add data for the proper step for raw data as it varies.
All I am interested in is a valid step for the frequency entered
so if I move it to a vfo it is correct.
Most steps are 5. 12.5 15. 25. 30. KHZ. Not only the AR8000, but
apperently all scanners compute the frequency on entry by dividing
the preset step into it to see if it is valid. That may explain the
5. Khz step found in the 154 -156 MHZ range IMHO. The assigned
spacing in this range is 15.MHZ A PP frequency has a factor of
15 in say 156.150 or 156.165. A fire frequency dosn't! (examples
154.160 154.175 etc.) The largest common factor of step 15 is 5.
so the designers just go with step 5.KHZ for the whole vhf range.

The government gets slick here by assigning some of its radios
uses by sensitive agencies steps that have a factor of 2.5 KHZ,
Only a top quality radio that has programable step size can
take that frequency and display it.But if the mode is NBFM who cares
even a poor scanner may hear the transmission well enough for
one to understand it.IMHO this is why I read in Monitoring Times,
Popular Communications, frequencies that I know are wrong. The
person sumiting what they found was using a cheap scanner
and it showed the nearest possible frequency it could go to
but it wasn't the actuall frequency the government was using.

What is really anoying is to read a list that includes both
correct and incorrect frequencies in an expensive book proporting
to be 'Secrete Frequencies'!

Examples of slick frequencies used near me are
161.0975 161.1275 161.1875 etc in conjuction with the military base
and civilian agencies.You may notice other areas where things
like this hold true also. Useage of the 450-451 band comes to mind
as an area manny cheap (and expensive Pro43!) radios can't
step onto commonly used frequencies because of an improper
preprogramed step.Try 450.5625 450.5875 450.6125 MHZ Step is 25 KHZ,
what does your radio step in this range? Try setting
the step to 25 KHZ and program one of those frequencies.
Ha HA it will not work! You must either have an AR8000 or set
the step to 12.5 KHZ! 25 KHZ is not a factor of those frequencies.
The 2006 is an example of a radio that can take this frequency.

Of interest, the AR8000 in AUTO mode from Europe is preprogramed
to step correctly in this area. The Pro43 is not!

From: odwill@xmission.com
Message-ID: <3dn5of$cpl@xmission.xmission.com>
Source record: 263645

I have a Regency 4020 200 ch handheld scanner. The box says it was manufactured by Uniden for Regency. Regency is out of business as far as I can tell. The question is, since everything I read about the Uniden BC200XLT seems to be identical to the Regency 4020, even including the instructions for 800 Mhz Mod, are the radios identical enough to interchange battery packs, mobile power adapters, etc? I am interested in getting a spare battery pack or two and a cigarette lighter power adapter for emergency use. Any help greatly appreciated.

Marc B. Grant (marcbg@metronet.com) wrote:
: I've sold thousands of $$$ worth of equipment on the net, and to date,
: I've dealt with good, honest folks who are looking for value.

: You know, I'm getting a little ticked off at some folks who believe that
: they are the Price Police, feeling free to make snide remarks, both via
: Postings and e-mail concering the pricing of people's equipment. I'm not
: one to flame, but I'm pissed, so are many others of us, and let me explain
: why.

: I posted a radio recently which sells at a street price for over $450 -
: for $315. It took me two months to sell it because of smartass folks who
: posted to the newsgroup
^^^^^^^^^^^^^^^^^^^^^^^^

Posting things for sale in the newsgroup lends itself to whatever comments
anyone wishes to make. That's what these newsgroups are all about.
The fact that other's opinions of your selling prices may make your
ability for a quick sale difficult is really not an issue...that's the
nature of the ongoing dialog internet newsgroups foster.

: AND sent me mail with offers like "$175" or posted
^^

You advertise an item for sale and you don't expect counter-offers,
even rediculous ones...then don't advertise on the net, simple no?

: things like "I can get it for $350" etc etc etc.

Again, nothing wrong with these statements last time the first amendment
was checked.

: When I finally sold it,
: the guy I sold it too was TICKLED with the purchase, realized he saved 30%
: off the purchase price of a new radio yet still had all the value of
: buying a new unit. He even called after he received the unit and used it
: a while to thank me.

So what's the complaint? Yes, I know see what follows:-)

: What pisses me off to no end is when I get cute little remarks BOTH via
: e-mail and postings that say things like "Good price - NOT" or "This is
: priced too high - you are trying to rip people off" or "What's the matter
: with you" or "Your price is ridiculous" - these are actual snips from
: actual email messages. I know many of you who sell things on the net have
: received them also.

Then don't advertise on the net...it is that simple.

: Folks, this is a free market. If you have a beef with prices, then write
: the poster personally (Don't post it to the group) with something like:
: "Marc - your price seems a little high. A new radio at XXXX costs only
: $ZZZ, and I was wondering why your price was so high. Just thought I'd
: let you know, and anyway, good luck".

In my several years of net involvement I've received email I didn't want
or replies to my posts that I'd have preferred not to have been so
posted, BUT I don't recall ever trying to gag anyone else from making
whatever posts they want.

: That's what I do. A nice polite note. You know what? I've received
: phone calls thanking me, because the poster didn't have a clue that they
: were overcharging. But what type of response would I get with "Hey, are
: you trying to rip people off?" Probably not a good one.

So delete the email or mark the newsgroup post as read. If a serious
valuation dispute exists it will get it's fair hearing in the internet
market-place of ideas, if your price is reasonable you'll quickly sell
whatever it is you've offered for sale.

: OR, just shut up and save the bandwidth.

See comments below.

: In the spirit of the season, I bope that those of you who are members of
: the Price Police take this to heart. Folks on r.r.swap, scanner, and
: r.r.a.m. are smart enough to judge for themselves - and if they're not,
: they can always post a message inquiring what the price of a particular
: used item should be. And if they're not that bright, well, then they
: should buy retail and stay out of the Usenet grabble.

And in the spirit of the season, recognise that those smart
enough to do so will separate the wheat from the chalf and things
will go on.

: If you have nothing better to do than to flame about someone's high
: prices, I suggest you are spending too much time in front of the CRT.

I'm always amazed at how other people seem so informed as to question
how anyone else spends their time. Frankly, if someone gets their
jollies participating in internet dialog, email etc then why should
I or anyone else care if they do it 24 hours a day, seven days a week.

: And to all, a Good Night. . . . .

And a Happy New Year to all too :-)

--
Bill Sohl K2UNK (Budd lake, New Jersey) (billsohl@planet.net)

I know what you mean "never heard back". They have the same postoffice as
I do. I sent several notes and even tried to trace down owner - no luck.

>There is another group called Comsec, which advertises in various pubs.
>They had an ad for such a bypass device in the RCMA newsletter. I'll post

Sure would appreciate the number. I think that "Comsec" is the outfit I
had a number for. I requested a catalog but never got one. Will try again
when I get number.

>Our cities have installed GE/Erickson systems, which have an annoying
>anti-scanner tone after each transmission. I wasn't aware of Motorola
>doing that too, but such a device may be of use. I have not personally

Our radio system may be GE also. I'll have to check - last one was Motorola
so I assumed this one was also. Sounds like same problem I'm having.

I recently purchased from the West Coast a Radio Shack 2026. From everything I had read, this was strictly a mobile scanner hard-wired for a car. However, the unit I got has an ac adaptor for base-station use and a DC converter for cig lighter. Is anyone familar with this unit which also has a preprogrammed frequencies: Wx, pox, fire, marine etc. And is cell-compatible. I'd like to hear any comments. Thanks.

If you come up with any good relatively inexpensive ideas, I would also like to know. We page a large number of people and need a way to verify that the page went out.. I would really like something that would talk to a PC and match up a monitored page with a sent page to confirm its accuracy. If the page didn't go out in a couple of minutes then tell my page pgm to re send it... Thanks for any info ....

> how to use the basic functions?

You can reach Icom (Australia) Pty. Ltd. at
7 Duke Street
Windsor, Victoria, 3181, Australia

Voice: 03-529-7582
Fax: 03-529-8485

Telex: AA 35521 ICOM AS

That's probably the closest to you. If you need US, UK, Canada or
Europe, email me.

The scanner is *not* very intuitive to use.

CL switches from Memory mode to VFO mode. It also is used to stop
scanning or clearing.

MR switches from VFO mode to Memory mode. Also, in Memory mode changes
the channels in units of 10.

The numbers in VFO mode input frequency, in Memory mode the channel.

The up and down arrows are self-evident in function.

EN enters input.

On the side of the scanner, W (for "watch') enters Clock mode; F is
the Function key.

If you push the tiny keys without the Function switch depressed, they
do what is printed ON the key (not above it).

What happens if you press a key with the Function switch depressed
depends on mode:

Key Name VFO Mode Function Memory Mode Function
^^
F + 1 MODE Selects receive mode. Not used.

F + 2 T.S. Selects tuning steps. Not used.
F + 3 SKIP Not used. Designates skip channels
for memory scan.
F + 4 AP ON [Starts power ON timer--but only in Clock mode.]
F + 5 SLEEP Starts sleep timer. Starts sleep timer.
F + 6 MASK Not used. Turns memory mask
function on/off.
F + 7 PRIO Starts/stops priority scan. Starts/stops priority scan.
F + 8 SET Activates SET mode. Not used.
F + 9 DIAL SEL Selects steps for DIAL SELECT. Not used
F + . SEL-M Not used. Starts/stops memory select
scan.
F + 0 MODE-S Not used. Starts/stops mode select
scan.
F + EN AUTO-MS Starts/stops auto-memory Not used.
write scan.
F + CL M>V Not used. Transfers memory contents
to VFO.
F + MR MW Writes to memory channel. Not used.
F + up P-SET Activates mode for setting Not used.
arrow programmed scan frequency
range.
F + down P-SCAN Starts/stops programmed scan. Starts/stops memory scan.
arrow

In Icomese, regular scanning is called "memory scan" and "searching"
is called "programmed scan", with the limits called "edge frequencies".

To set the programmed scan first enter VFO mode; then while pushing F,
push the up arrow (P-SET) to select Program Set mode. You get ten sets
of edge frequencies, numbered from 0 to 9. Use the up/down arrows to
select the one you want. Each set has an A and a B frequency to set.
Set the frequencies and modes you want. Select the group you want to
scan. Return to VFO mode by pressing CL.

Per the manual, don't charge the battery for more than 48 hours.
Book says about 15 hours should do it on the small wall charger
(not the BC-72--that's about 1 hour)

Charge the battery as soon as the "B" appears in the display.

While pushing CONT, turn the tuning knob to change the display
contrast.

While pushing F, push LIGHT to deactivate keyboard and tuning knob.
Squelch and PWR/VOL will still work. Do it again to reactivate.

Resetting *only if you have to* is done by simultaneously pushing F
and CL as you turn the unit on. This blows out all your settings and
restores the unit to factory defaults.

The default settings for the channels and masking options:

Channel Initial Setting Main Use and Characteristics
^^
0 144.000 MHz. Only this channel cannot be masked.
1 - 19 144.000 MHz. Used as normal memory channels.
10 - 79 Masked Skip designation area for programmed
scan.
80 - 99 Masked Frequency writing area for auto-memory
write scan.

Set Mode settings (Look at what legend appears in display's lower right):

SP is scan speed. 10 or 20.

PA limits range for memory scans (used with PB) (use tuning knob).
PB limits range for memory scans (used with PA) (use tuning knob).

SC turns programmed skip function on/off. When set to off, you cannot
skip write in a SKIP command during programmed scan or execute
programmed scan.

SC Scan resume condition (t - 10 means pause for 10 sec., then resume.
P - 02 means stay on signal, resume scan
two seconds after signal stops.)
LI Lamp (either stays on or stays on for 5 seconds.)

bE Beep tone on/off.

bL Rx lamp on/off.

PS Power saver time ratio.

SS Power saver scan on/off.

Of course, there is more, but these are the basic things. You really
ought to get the manual.

I have 2 2026s, other than being a 'sponge' for intermod on UHF, they have been fine as replacements for packing a handheld around in the car. One (in a POV) shares the AM/FM antenna via a cable TV splitter, it's not the greatest reception possible, but it keeps the pager-tones from wiping out public safety traffic on UHF. The other, in a commercial vehicle has switchable antennas, for sometimes I need to have the best possible reception, but for most of the time, it is using a homebrew 15" whip mounted on the 'cage' inside of a van.

Only other advice is to keep your 100 frequencies written down. Any hint of back-up memory without b+ is nil.

Hmm they must need some sort of repeater. The Handhelds arent powerfull enough to reach accross town let alone a few cities away. Unless thay installed cell-like repeaters. Anyone else got any info?

> I'm hopin to make a discone for wideband reception. Hopefully
> from around 1MHz up to 900MHz. I have the following questions:

you're not going to get from 1 to 900 MHz in one antenna. 10 to 1 coverage is about what you'll get.

a good reference for discones is the RSGB (Radio Society of Great Britain) VHF UHF manual. in the 4th edition, it's section 8.37.
>
> 1) is the "driven" element the "cone" or the flat horizontal "disk"?

the disk. diameter is 70% of a quarter wavelength of the lowest frequency.

> 1a) which is the ground plane, the disk or cone?

the cone. length is a quarter wavelength of the lowest operating frequency. kinda big for 1 MHz. You could cover it with cloth and live in it like a teepee I guess.

> 2) any guidelines you can suggest for size of disk and cone?

see above. the critical dimension, that sets the operating impedance, is the diameter of the top of the cone. figure this is .5 inches. the spacing of the center of the top disc to the cone top is 20% of the top cone diameter (here .1 inches) for 50 ohms. make the cone angle 60 degrees

this is the hard part. if you're just going to use the discone for receiving, then the impedance isn't as critical. it is critical if you are going to be using it for transmitting as well.

you can make throw-away discones out of metal screen and brazing rods. you can make a good one if you have access to a lathe. or, if your time is worth more than that, you can buy one.

>
> 3) vertical antenna added to the driven element adds gain to what frequency
> range?

a vertical (commonly base loaded) adds to the low frequency response and is a crock.

> 3a) is the vertical whip added because of weak gain in a certain freq range?
> 3b) what size do mfr's typically make the vertical piece?
>

> I realize there is no "prefect" antenna to receive all freqs - just
> one that can do a decent job. That's all I'm looking for...

if you hook a discone up to a scanner with a wide front end, every signal in the range of the antenna is going to be dumped into the poor beastie's front end- with interesting results. you'll be able to hear things that you not only haven't been able to hear before, but things that don't really exist as wild mixing products are formed in the overloaded front end.

cheers-

I said:

: But it -doesn't- cover the least interesting portion of the 800MHz
: band--which is cellular

Then sbradley jumped in:

[incessant politicking and rambling omitted]

sb> In any event, the
sb> fact is folks are ALWAYS going to listen to cellular calls, and no law
sb> or other government action will change that. Fact!

WHY?? Because it's illegal? My Goddess, get a LIFE! Maybe the rest of the world is different from the areas I've visited, but listening to telephone calls is on par, excitement-wise, with tuning into a non-existant TV channel and watching snow. THERE'S NOTHING THERE!! If you listened to me, what you'd get is "Hi, I'm on my way home. Sure, go ahead.. cigarettes, milk, and a paper, okay, I'll pick them up on the way out." or "Hey, when you come out to meet me, don't forget to bring my charger with you, please" or something like that. Same goes for McDriveThrus around here. AND cordless phones. If you're REAL lucky you can catch someone on a cell or a cordless phone calling Pizza Hut to get a pair of large pizzas with pepperoni and ham delivered!! Wow, I bet that'd make your day!!

Grab a grip.

>the guy I sold it too was TICKLED with the purchase, realized he saved 30%
>off the purchase price of a new radio yet still had all the value of
>buying a new unit. He even called after he received the unit and used it
>a while to thank me.

It took you two months to sell it because you had it priced too high
to sell quickly to well-informed buyers, that's all. The purpose of
posting mail order prices etc. to the newsgroup is to help buyers be
well-informed. Remember, it's an *information* exchange.

>What pisses me off to no end is when I get cute little remarks BOTH via
>e-mail and postings that say things like "Good price - NOT" or "This is
>priced too high - you are trying to rip people off" or "What's the matter
>with you" or "Your price is ridiculous" - these are actual snips from
>actual email messages. I know many of you who sell things on the net have
>received them also.

I agree flaming is inappropriate unless it looks like the seller is
deliberately trying to find an uninformed buyer to overcharge. But
any beef against informational non-flaming posts seems self-serving on
the part of the seller.

>Folks, this is a free market. If you have a beef with prices, then write
>the poster personally (Don't post it to the group) with something like:
>
>"Marc - your price seems a little high. A new radio at XXXX costs only
>$ZZZ, and I was wondering why your price was so high. Just thought I'd
>let you know, and anyway, good luck".

I disagree. The content of that letter is ok, but it should be posted
to the group, not sent privately to the seller, since prospective
buyers need this information even more than the seller does.

Hey guess what, Delta Airlines will not permit smoking on
ANY of it flights starting next week.They claim to be the only airline
in the world to make that move.

Since I don't smoke and my wife can't stand to be around those that
do, we will start using delta exclusively even if they cost more.
Do they permit radios to be used in flight?

You can find information in html format if you have a web browser
on the ar8000 via url

ftp://ftp.crl.com/users/ro/vhealey/www/ar8000.homepage.html

Someone may have done the same for the Yupi but I doubt it.
The ar8000 is a far more sophisticated radio for the money.

Vic

7412. BC9000XLT INFO!

Newsgroup: rec.radio.scanner
Date: 1994-12-27 13:53:25 UTC
From: Jeff Goldman <76703.4224@compuserve.com>
Message-ID: <3dp68m$l01@panix3.panix.com>
Source record: 263671

Special features of the BC9000XLT, due late January 1995:

1) Data Skip during Scans or Searches

2) You can search at 300cps in ANY band as long as you're in 5kHz increments.

3) You can lockout up to 50 channels during a Search.

4) Channel delay is settable PER CHANNEL, not global.

5) An attenuator gives 15dB of attenuation and is settable PER CHANNEL, also not global.

6) You can use stereo earphones with the BC9000XLT; no adapter needed.

7) You can search Up OR Down in frequency.

8) There'll be a Hi Cut filter to cut highs if the signal is overly hissy.

9) User selectable modes include WFM, NFM, and AM

10) There will still be a VFO and hit counter in the new base, whereas the new handheld, the BC3000XLT won't have these.

11) Only thing you lose is the ability to use the Priority feature during a Search. It'll still have only 250 alpha memories out of 500 channels.

12) There'll still be no Wx Search, but you will have the option of putting the same optional BC005 PL board that the BC8500XLT uses.

-Jeff, CIS HamNet Scanning Sysop

There are many "mods" for the BC-890XLT. What would you like the unit to
do that it doesn't do now?

7420. PRO-43 MOD FAQ???

Newsgroup: rec.radio.scanner
Date: 1994-12-27 16:22:08 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <3dpevg$tsc@tiger1.ocs.lsu.edu>
Source record: 263667
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Is there a FAQ for the PRO-43? I am also curious about the date code on those units...somebody posted that if the date code inside the battery compartment has an 'A' in it, then it is a post-ban scanner . I thought they produced the pre-ban scanners until about june of 1994, so a date code of 6A4 (or 4A6, I forgot the placement) while having an 'A' in it would be a pre-ban.

Can anyone shed some light on this?

Thanks,
Dave

7421. Re: AOR 8000 vs. Yupi

Vic,

I don't want to start a Yupi / AOR war here but lets be honest
when talking about the two radios... AOR has not had the best quality
record and just because they come out with a scanner that has tons
of extra toys does not mean it does better on what it is supposed to
do. IE recieved radio transmissions... The Yupi has been tried and true
in this department and still is according to most more sensitive than
the AOR... I had owned an AOR but got rid of it because of the problems
with quality (even the 8000 was shipped with a pretty major bug originally...

I work in the consumer products development and I would have never
let such a device ship...

My opinion, waiting for all the bugs to come out before I purchase
the 8000, Yes, I will get it, I must have the newest toys. :-)

They are really called car extenders. Since CHP uses frequencies in the
42MHz range, the extender acts like a small cross-band repeater to
translate the 42MHz to the 154 MHz used on their handhelds. This does
make if nice to have my 2 Meter handheld scan this CHP frequency while on
the freeways. It does tip me off, but it does nothing for me for the
CHP officers on bikes. The do not have a car extender.

Whew. I knew I'd receive mail on this, but the magnitude is amazing. As many can tell, I am merely trying to raise this issue, since I've never seen it presented here before.

As for the comments I've received as to Hamfest pricing, it's alot different when you're dealing with someone in person - at least you usually respect them, even if they are trying to sell a HT-101 for $950. You may wonder what they've been smoking, but at least you look at the price and move on, scratching your head.

Another valid sentiment I received is to simply ignore the comments and keep on chuckin' - which is what I've been doing for three years now. I think with the advent of AOL, CIS, and the general internet explosion, we have more traffic, and despite the Usenet Sale Guidelines (which no one seems to read anymore!) there's alot of extraneous comments about pricing which just seem downright rude.

I've changed my tune on one item - IMHO, it's alright for the person complaining about the price to post an email and newsgroup message - but for crying out loud, do so in good taste! It IS a good method for those unaware of pricing to see the general flow of things and determine for themselves if the item is overpriced.

Don't get me wrong - I'm not for ripping anyone off - never have and never will be. But, there's fair pricing, there's outrageous pricing, and then there's pricing that makes you wonder if you'll burn your hand when you touch the unit.

If this discussion turns a light on in one person, then I've accomplished what I was after - raising the consciousness of sellers AND buyers on the net concerning pricing, courtesy, and common sense.

: I hope this inquiry is not for an illegal venture. It is illegal to
: use any of the information you may see off the pager frequency.

Aww Gee, give me a break! First off, let me set you straight on a couple of items.

(1) I don't give a d*mn about any law(s) which may or may not exist. They don't stop my cellular monitoring, nor my cordless monitoring. As I recall, you've got to be violating the law in the presence of a law enforcement officer for *any* action to be taken. As per pager info, that's funny -- down here I have heard from reliable sources that some law enforcement departments are using alpha pagers to relay confidential past criminal history data due to it being illegal to transmit it over conventional radio. There are quite a few chuckles which can be had on the alpha transmissions.

(2) The M-400 decoder has been manufactured and sold in the US for the past TWO YEARS, hardly suggesting it's an illegal device!

(3) A parallel to serial converter is a device which takes the parallel printer output (yes, it has one for printing what is "heard" on those "illegal" pager frequencies) and converts it for serial for computer terminal software to store, capture, scroll through it, in mass amounts. It takes a printer connection and makes it plug into the computer where the modem would.

(4) As suggested in (1) and (2) above, I do not care about the so-called laws about cellular/cordless/paging/broadcast-relay/ECPA/communications acts of 1934, they are all unenforcible, unless you're dumb or stupid and carry out such action in the complete view of the law. The privacy of my home provides plenty of enjoyment indulging in all of the activities which supposedly are illegal. Guess what? It's not stopped me or anyone I know. They are laws without power of enforcement. Therefore, no reason to even consider obeying them.

(5) The last time I checked, these were INTERNATIONAL newsgroups, and what may be illegal in one country may be completely legal elsewhere. In any

event, the discussion and distribution of information is completely, 100% legal in the US. If this bothers you, go pick on the alt.2600 folks!

7430. Charging BP-200 while detached from xlt?

Newsgroup: rec.radio.scanner
Date: 1994-12-27 22:13:32 UTC
From: Pete Fanning <FANNINGP@MUSIC.LIB.MATC.EDU>
Message-ID: <27DEC94.18603771.0022@ESAMATC.LIB.MATC.EDU>
Source record: 263552

Greetings!

Santa was nice this year :)

Got a BC200XLT, with a modified battery pack that lasts up to eight hours, and I find I want to buy a spare battery pack so I can swap between the two.

My question is, and forgive me if this sounds like a rediculous question for some of you seasoned vets, can I charge the BP-200 pack even when it is not attached to the scanner? That way, I can always have a pack on the charger, and one on the scanner and flip flop as needed.

I've never really dealt with a nicad battery pack before, thus the question. I just wanted to make sure I can do this before I try it.

Love my scanner. Can anyone recommend a decent database program that I can use to keep track of all of my banks? I've seen several, but most don't cater to the sophisticated scanners we now have.

I'm thinking of writing my own in Clipper 5.02d, but if I can find a package that you all absolutely love, and I find that I do too, then I'll reconsider.

Thanks for your help in advance.

Pete Fanning

: do, we will start using delta exclusively even if they cost more.
: Do they permit radios to be used in flight?

Heya Vic! Well, this is really what the debate was about, but I have
read in Delta's in-flight magazine that VHF/UHF receivers were permitted
(same goes for HT's for listening), but Ham Radios (must be for
transmitting) and not permitted. Furthermore, nothing can be operated
during takeoff, taxi, landing, initial approach, or anytime when ILS or
EFIS is used.

Several months ago I read in Popular Communications that the FCC was considering the addition of 15 handset/base frequency pairs for use in cordless telephones. These frequencies would be near the current 46/49 pairs (i.e. analog). Does anyone have any further info on this?

Tnx...Dave

Does anyone have mods (or know where I could find them) for the
Radio Shack Pro-2022 scanner? I've checked oak.oakland.edu and all
they have is the 800Mhz unlock mod.

Thanks,

Dave

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. A new law threatens to outlaw listening to cordless phones, too.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many | of the AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to | receiving images -- receiving the same signal erroneously | on two or more frequencies. With a few exceptions, images | are undesireable due to the interference they cause, e.g., | hearing aircraft transmissions while the scanner is tuned | to the local police frequency. Premium quality scanners | use "up conversion" circuitry, a scheme which greatly | reduces image reception. |

Currently, the more popular scanners include the Uniden/Bearcat B760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT), 220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 and the Uniden/Bearcat 8500XLT and 2500XLT. New Uniden replacement models, the 9000XLT and 3000XLT, will be available soon.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion | and are made for Radio Shack by GRE (General Research | Electronics). Both GRE and Uniden make scanners for Radio | Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. |

Portable scanners are supplied with a spring shaped | antenna, covered by rubber. Although it is small and | tolerant of physical abuse, the range of a heliflex antenna | is very limited. Augmenting it with a 19" telescoping | metal antenna can improve portable reception greatly. |

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane | type antennas can be more prone to lightning strikes because they are not at "DC ground." |

Coaxial Cable Feedlines |

If your antenna installation requires more than 50 feet of | feedline, use RG213/U or high quality RG8/U coaxial cable. | RG213/U has a non-contaminating jacket and will last | longer. Each has an outer diameter of about 13/32". | Similarly sized Belden 9913 cable and clones have lower | attenuation but are difficult to bend, require special | connectors, and can accumulate moisture inside because it | they are hollow. |

If you must use a small diameter cable for long runs, use | RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high | frequencies. RG8/X (1/4" OD) is suitable for short patch | cords. |

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom color map. I call this new innovation RadioMap(TM) service. It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave.

This is completely different from the limited maps displayed on the Grove Enterprises CDROM. Through a new licensing arrangement with a professional mapping company, RadioMap shows detailed streets, railroads, rivers, and cities. Ham radio stations are not shown as they would clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, suitable for framing or laminating, for areas in any of the 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern | states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, | about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio | equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various |

communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year | subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer | bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All | meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept. |
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

Could someone else please confirm or refute this in the case of
Pro-43's? I know for a fact that it is _not_ true of Pro-39's, having
modified one with an "A" in the SN. I thought the relevant info was the
date as reflected by the digits before and after the "A" (e.g., 3A4 =
March 1994), not the presence or absence of an "A."

Well, you sure haven't listened to cellular phones after a long week-end, or after a holiday... or just after a business day when mister calls missis to say he has a business dinner, and then, after hang up, he calls mistress and says "OK for tonight babe"... or something. Now with digital cellular phones, this IS getting harder, but people just don't seem to understand that cellular phones are NOT secure at all...

Now, here in France, cordless phones are on 26-27 MHz, which makes listening them very easy with a CB radio that you can buy anywhere. It's all FM transmission so you just need a 120 channel AM/FM CB radio to listen in. That stupid of our government not to allow 49 MHz cordless phones (much less 900MHz!)... Especially as half of the scanners you'll find only go down to 68MHz. but then, who said governments had to have brains?

Cheers,
Gilles.

By the way, on a remotely related matter, does anyone know what type en encoding is used on AT&T 9120 (900MHz) cordless phone?

Thanks!

For what it is worth...
the "pairs" are less than that, ie the proposal was to unconnect the
sets of two freqs so that any inout could be used with any output,
in the name of less interference. Sounds wierd to me, but that was the
proposal. I haven't seen any action on this in over a year!

> ... the date code on those units ...

Radio Shack items have a date code in the form 'mmAy', where 'mm' is the month and 'y' is the year (the 'A' stands for A & A Trading, Tandy's import arm). 6A4 indicates an import date of June 1994, after the April cellular cutoff.

Radio Shack radios have an FCC ID of the form AAOnnn-nnnn, where AAO is the FCC Grantee Code for A & A Trading and nnn-nnnn is normally the catalogue number of the item. PRO-43 scanners with an "A" at the end of the FCC ID (AAO20-300A) are not modifiable.

Unmodifiable PRO-43s also have an "A" preceding the serial number.

7455. Scanner Notification Nets - How to start???

Newsgroup: rec.radio.scanner
Date: 1994-12-28 14:25:04 UTC
From: rbellville@aol.com
Message-ID: <3drsg0$bba@newsbf01.news.aol.com>
Source record: 263577

I would like to start a scanner notification net or monitoring group in my area.

PROBLEM: I cannot generate any interest no matter how I try to promote it!

Here's the scenario...

I love to listen to the scanner. I have one in every room in the house except the bathroom. (No place to plug it in. :-)) Sometimes, I do turn it off and that's when all the good stuff happens! I would like to start a group of other scanner enthusiasts that would like to communicate via radio (GMRS, commercial, ham, CB...) to notify the other members that some sort of hot action is happening on the airwaves.

I live about 45 miles west of Boston, MA. That city has MANY different groups that are organized, some professional media, firefighters, etc., some not. I am just out of their repeater range and they don't cover my area.

Now, I live in Worcester, the second largest city in Mass. (pop ~150K). I also have exclusive access to a beautiful hilltop over looking the city in which I could put my UHF repeater (either GMRS, commercial or 440mhz ham band). I can offer the repeater for zero $$$ so the cost of membership fees would be VERY low. I do not personally know any other scanner nuts in the area so I can't start even a small group to just get going.

I've tried putting flyers in the local library, posted messages on the local packet BBS as well as nearly all the area LL BBSs, tried Internet postings, Radio Shack won't place any flyers in their stores (company policy), a classified ad in a local newspaper, etc.

Did I miss anything? I know that scanners do sell well in the area as I have spoken to the Radio Shack folks about it. Is their some other ways of getting to the people that own scanners?

I'd like to hear from anyone who has started such a group or is involved in one. Any assistance/advice greatly appreciated!

How can you say that listening in on someone cordless phone
conversation as an invasion of privacy? When someone uses a radio
with encryption to communicate over the public airways, that someone
looses all expectation of privacy. This has been ruled on by the
Supreme Court.

Cheers

> I hear the AOR1500/8000 are great scanners. Could anyone help me with
> this decision?

Hi Charles,

I have been using both the AR3000-A and the AR8000 for quite
a while now. Both are excellent radios (I think so anyway).

Obviously if you are going to be using the scanner out and
about then the handheld AR8000 is much better. If your going to
be using it in the car or home then go for the 3000-A, I know it
costs nearly double. But believe me it's worth it....

The freq coverage on the radio's is vast, 150Khz to 2036Mhz
(that might be restricted in your country), and in all modes.

all the best for '95

7460. Pro-23 for sale

Newsgroup: rec.radio.scanner
Date: 1994-12-28 16:03:06 UTC
From: chuck609@aol.com
Message-ID: <3ds27q$8sg@newsbf02.news.aol.com>
Source record: 263581

Realistic Pro-23, sold by Radio Shack. Like new condition, rarely used. This
model just came out over the summer, and has already been removed from the
shelves to be replaced with units that are not 896-698 MHz restorable. So I
guess this one's a collectable?

50 programmable channels + built-in NOAA weather frequencies plus 10
additional temporary storage channels. Frequency coverage: 108 - 174 MHz, 406
- 512 MHz, 806-823 MHz, 851 - 869 MHz, 869 - 896 MHz (restorable), 896 - 956
MHz.

Scans 12 channels per second. Light weight and ergonmically well designed.
Includes transferrable 5-year service plan (repair or replace) good at any
Radio Shack store. Will throw-in suction-cup car-window antenna adapter. The
unit has Ni-Cads loaded, which can be charged in the unit with a standard 9
volt AC adapter.

Includes original box and manual. Asking $135 (plus shipping). Prepaid via
money order or COD ok.

Why dont you try and find a powersupply that will run the scanner and make sure its the battery before you go buying a new one. all you have to do is hook up the power supply, BEING SURE TO OBSERVE POLARITY OF THE RADIO <+ AND ->, and turn it on and see if it works, if it does, you need a new battery, if not, your radio is on the blink. Of course you assume liability in case you screw up the hookup, not I :). 73 brian

>
You didn't say what part of Canada/USA you wanted. IT'S A BIG BORDER!!!
But anyway here is the frequencies I have that work in Ottawa, covers
Northern NY, VT etc... NOTE: quite a few freqs listed are blank, a/c may
have been monitored, but not enough info transmitted to confirm type etc.
best situation is when you get a pirep. Dogfight (TOPGUN type) activity
is fairly common over Northern VT with the F-16's of the 134 FS VT ANG
plus lots of tanker traffic as there is a tanker track near there as well

We are in a final test mode of software which decodes pocsag (most) pager traffic. The only hardware required is a +-12 volt hamcom interface board. Of course, you must tap off of the FM discriminator output for a nice square wave input to the hamcom board. We will sell this to the pager test equipment market for $275.00 after our beta test...

Too bad it's illegal because sheer boredom beats the hell out of any
legislation in stopping people from listening in on private conversations.
Making it illegal almost makes it attractive when the intent was dissuade
people from doing such things as "conversions" or "tuning in" to these
frequencies.

Hi Chris

I too would be interested in the parallel to serial convertor for the M-400. I have tried a few printer redirecting TSR's but have had not luck yet. I also have the rome revision v1.02, although a friend of mine in Australia has recently purchased one form the US with the v2.00 rom. This apparently allows him to decode the 2400 baud or high speed paging. Let me know if you have any luck with the software..

7479. 240-300 MHz MilSat Antenna..ideas?

Newsgroup: rec.radio.scanner
Date: 1994-12-28 23:14:27 UTC
From: daryll1@aol.com
Message-ID: <3dsrgj$b11@newsbf02.news.aol.com>
Source record: 263583

Anybody know where I could purchase a decent antenna for the 240-300 MHz military satellites? This crummy discone just doesn't get it. How about making one from a VHF TV antenna? If the elements were trimmed to the correct length and the thing was aimed right, think it would work? OK, so the TV antennas are linear and the MilSats are circularly polarized (mostly), but with a decent preamp maybe it'll work. Anybody have any experience with this?
Thanks.....Daryll

FirePage (Fire Notification System)
(310) 838-1436 CIS:71674,1610 Internet: mpage@netcom.com

Instant notification of all working fires throughout California. Now includes Los Angeles, Orange, Riverside, San Bernardino, San Diego, Ventura, Santa Barbara, Santa Clara, San Francisco & Contra Costa Counties.

Notification of major incidents from our affiliates in Atlanta, Boston, Chicago, Denver, Detroit, Florida, Hartford, New Jersey, New York, Phoenix, Twin Cities, Virginia and Washington DC.

FirePage is run by our volunteer dispatchers who monitor the fire frequencies in their areas and dispatch the information to the entire network. They are able to listen to much more than any individuals and share the information with everyone.

* Alpha-Numeric messages
* Includes personal pages
* 24 hrs a day, EVERY day

* Volunteer dispatchers are always needed throughout California

If you are interested in fire related incidents and want to know what's happening throughout California and the rest of the country (before the national wire services), let's hear from you.

Source record: 263608

: Hey guess what, Delta Airlines will not permit smoking on
: ANY of it flights starting next week.They claim to be the only airline
: in the world to make that move.

: Since I don't smoke and my wife can't stand to be around those that
: do, we will start using delta exclusively even if they cost more.
: Do they permit radios to be used in flight?

In Australia (where I am) smoking is banned on all domestic flights. This is enforced by the major domestic airlines including smoke detectors fitted in the toilets.

Scanners are NOT allowed either.

In an inflight book that I have of an Australian domestic airline it says:

ELECTRONIC DEVICES

Handheld video cameras, portable palmtop/laptop computers, compact disc players, cassette players, personal organisers or personal video games CAN BE OPERATED, but only while the aircraft is in cruise.

The following CANNOT BE USED AT ANY TIME onboard an aircraft: radio receiver or trasnmitter, commercial video camera, video recorder, tv receiver, large tape recorder or mobile telephone.

SMOKING

Government regulations prohibit smoking on all Australian Domestic flights.

So this is what happens with smoking and scanning in aircraft down under!

Cheers and Happy flying....

Source record: 263610

Can someone tell me from EXPERIENCE how long the memory lasts in the AOR 1000xlt scanner without batteries fitted?

I want to remove batteries for about 6-8 hours whilst travelling on an aircraft. Will I lose all my frequencies?

Im using 4 AA 600mh batteries now.

Thanks Matthew
matthew@hal9000.apana.org.au

PS I might point out that my Realistic PRo 2028 says 2-3 days wihout power but mine lasted over 9 days. Also Realistic PRO 35 (same as BC 100xlt) says 1 hour and mine lasted at least 6 hours.

How can we rationalize fighting for second amendment rights when
we trash the right to privacy? What's the difference between a
law abiding gun owner shooting someone because he'd "bored" and
using a scanner to invade someone's privacy? There's a discrepancy
here.

By law, we can listen all we want. We just are not allowed
to reveal that conversation which we heard to anyone.

This means, in theory, that if we assembled 20,000 people in one
large stadium, and intercepted a very erotic phone call, they
could listen, hoot, holler, etc., but would not be allowed
whatsoever to talk about it to anyone. this means they could not
talk about it to the guy next to them.

In reality, it happens. People use this sort of thing to gain
an edge, or, as is the case with most of us, we're "bored".

So you listen in on your sister talking about sex with her boyfriend.
Or maybe pick up a drug deal. A cordless phone is not a phone ;
it's a radio. The base unit is a phone. The rest is a hand-held
7-meter radio. Radio waves are radio waves. You can pick them up
just like a police frequency. You can argue the semantics involved,
but it's nothing more than a radio wave you're picking up.

Now, if you go out and deliberately tap someone's phone line, yes,
you are really invading privacy. Just because Aunt Mary doesn't
understand radio waves and doesn't know her cordless phone can
be heard by scanner enthusiasts doesn't mean she's right to scream
"Invasion of privacy!" A radio transmission *intended* to be private
is *not* private - it *can* be picked up by others who know how, and
who might be listening.

Oh, gee, the day I hear the governments of the world accuse each other
of invasion of privacy for intercepting intelligence radio reports
will be the day mass laughter erupts from the countries.

> ... if the cutoff was april are 4A4 date codes modifiable?

The nominal cellular cutoff date was 26 April 94. Since the date sticker
on PRO-43s could have been applied before or after the actual import date,
it is not a precise determinant. Rely on the FCC-ID, which indicates under
which standard it was approved. Anyway, if a PRO-43 is still lying around
the store, there's no guarantee it's in the original box.

Hardly. The person with the phone is broadcasting the conversation into MY house. If they want privacy, there are a couple of solutions. They can either use a wired phone or they can get one that is encrypted or spread spectrum.

A law abiding gun owner is not going to shoot someone without very good justification - boredom certainly does not qualify.

Not true. It is illegal to listen to cellular phone conversations,
period - without a court order. If the recent federal law has been
signed by Bill-Bob, then it is also now illegal to listen to the
wireless phone converstations. Of course, I am only talking about
the US. Other countries have their own banned communications list.

: This means, in theory, that if we assembled 20,000 people in one

Have you ever had any problems with the police confiscating a scanner from a ham radio operator? Just wanted to know if all the cops know hams are allowed to have scanners in their cars. I also have an Indiana State Police permit to carry a scanner. Have used that once, but haven't been bothered in the past five years as a ham.

The supreme court ruled that cordless phones are recognized as
radio stations, perfectly legal for anyone to listen in. One should
realize when using a cordless phone they are broadcasting to the
world and act accordingly.

Now if someone taps your phone line, thats a different matter.

I believe shooting someone does voilate at least one law.

Dead wrong. It is illegal to listen to cellular. This is not a general
wireless law, but specifically states areas in the 800mhz range that
are illegal to receive.

A supreme court ruling defeated efforts to make cordless freq. illegal
to listen to. There is no federal law prohibiting cordless reception.

However NY and CA have state laws concerning cordless freq., no other
state have laws to this effect as of to date.

: ---
: Harold
: hpeach@pop.uky.edu
That is a very neat system!!! I wish I can get the book store soon and
get wired, I saw it sitting there last time, and I started to pick it up
too!! :(Well, I guess it can't be much more than what Qualcomm sent me
thanks to J.B. Hunt Transport. I'm one of J.B.'s youngest friends of the
company to date (I'm 15). If Wired didn't mention J.B. Hunt's hookup,
your missing some details. J.B. Hunt Transport didn't use the OBC's
provided with the system, instead, J.B. went to IBM to develop they're
own OBC for use in the trucks. I got a "tour" of the system when I met
one of J.B's drivers at the grocery store. It has I guess a 7-9 inch
display screen, everything is graphical and touch-screen. I think its way
better than the OBC provided by Qualcomm. Also, J.B's OBC can hookup to
pay telephones and other RADIO bases equipment like Rockwell's and
Motorolas CoveragePlus system which was recently converted over to
Qualcomm's. M.S. Carriers of Memphis, Tn was the first customer to convert
from Motorolas CoveragePlus to Qualcomm's Satellite based system.

Later,
Ron

P.S. Anyone want to know more info about the trucking industry, or
trucking companys like J.B. Hunt, Schneider National, Just write, I have
lots of information from the companys directly!

Just a note to say that there is a more proactive paging group
in Michigan called the Michigan Public Safety Network.

The bulk of our members are public safety personnel who contribute
messages to share. The Michigan Public Safety Network
offers more fire and/or police messages than any other system
in Michigan. That is why it is prefered by the pros.

To get in on the action, dial 313-454-6111. You may call the
same number for information on other public safety paging
groups across the nation. Our counterparts are active in about
20 communities coast to coast and we'd be pleased to refer you
to the group closest to you if you're interested.

Happy New Year to all, and happy scanning!

Yes, normal range for "older" cordless phones. I say "older" because
the latest offering in the cordless arena are the new 900Mhz phones
which offer digital voice transmission and spread spectrum. Both
almost make it impossible for someone to hear you talking - all they
get is digital hash noise, at best.

:
: It depends on their antenna, the strength of your phone, and what's
: between 'em. Both out of the box . . . a few hundred feet, certainly. In a
: large city, that's a lot of potential listeners.
: BTW. Same thing applies to baby monitors!
:
: It's illegal to listen, if that's any consolation.

It is NOT illegal to listen to cordless phone conversations on
your scanner, unless you live in NY or CA which have state laws
saying it's illegal. There are no federal laws prohibiting
the intercepting of cordless phone transmissions. Cordless phones
are essentially little handheld radio stations. You can hear them up
to a couple blocks with the right antenna.

And in NY and CA, even though it is supposedly illegal to do,
you can bet that anyone having a scanner in those states will listen to
cordless phones whenever the mood strikes them. Most if not all scanners
can pick up the 46-49Mhz range cordless phones. Laws or no laws,
there is nothing to prevent people from listening to your
cordless phone conversations, and it will happen.

So, I would not consider anything consoling about talking on
a cordless phone if you are looking for privacy because it
is certainly not private.

CELLULAR phones on the other hand are a whole different story. There
are federal laws that say you cannot intentionally intercept cellular
phone transmissions (or any radiotelephone services). Cordless
phones are not considered radiotelephones.

Personally, I think laws against listening to cellular phones
are a crock - they also are not "private", but the cell phone
industry lobbied enough to get the laws pushed thru so they can
go back to their customers and say "these things are private - see
there are even laws to guarantee it". There are laws against
speeding, but it happens all the time when the cops aren't around.

Just be careful what you say on your cordless, or, get a wired
phone with a long cord. Same for cellular, athough the technology
generally affords you more anonymity (but no less privacy).

Mike

>(primarily looking for frequencies). Does one exist via ftp?

Bob Parnass maintains a suite of articles, but they aren't
cross-posted to news.answers (they *are* crossposted to
rec.radio.info, though). Since they are registered Usenet Periodic
Information Postings (see news.lists), they are also archived at
rtfm.mit.edu every time they are posted. You can obtain them via:

ftp://rtfm.mit.edu/pub/usenet/rec.radio.scanner/

or via E-mail server:

mail-server@rtfm.mit.edu

put in the body of the message:

help
index usenet/rec.radio.scanner

(Alert readers may have already deduced that this trick generally works
for most other newsgroups as well. Substitute the newsgroup name for
"rec.radio.scanner" above.)

When I first got my scanner, it dawned on me I could listen in on our
cordless and I tried it and sure enough it works. I showed same to
my two high school sons and I haven't seen them use the cordless
since.
:-)

BUT

One other thing dawned on me. I had been (PAST TENSE)
using the cordless to do my electronic banking. As you know
such a system asks you to dial in your account AND
your PASSWORD. YIKES !!!

I wonder how many passwords of all kinds go out
over scannable airwaves every day.

Last night, I heard a cordless conversation. The people had been using a cell phone for a private conversation, but stopped and waited until they got home to continue the conversation on their cordless. I can't get cellular, so I didn't hear that part, but they started their cordless conversation with something like how their cell phone conversation could be monitored, but it's not likely that their cordless conversation would be :-). Oh, the conversation I heard was about credit card numbers.

Anyway, when I do electronic banking, I'm keying my number with a touch tone phone. So I gather there are devices readily available that can record these tones and give you the corresponding numbers?

Yep. Exactly. It would be best to use only a wired phone, not cordless or cellular, to do account access stuff. Admittedly, the password used for phone banking is USUALLY NOT the same as your ATM PIN code, and USUALLY it is not possible to do anything from the phone like transfer money to another account number, but why take the risk.

The hardware to decode phone numbers, account numbers, or whatever you may send with touch-tone (DTMF) pads on a cordless or cellular phone is not only easy to obtain, it is trivial to obtain. Even a tape-recording of the phone call can be used to decode the numbers later.

As a very simple example, several of the local ham-band repeaters here read back the numbers you punch in when using the phone patch---

Bottom line--if it ain't wired, and you cannot be fairly sure it is not tapped, overheard, or scanned, DON'T use it for money or credit card transactions!

Wonderful world we live in, huh?

Cross-posted to: rec.radio.scanner,alt.radio.scanner

Has anyone come across a DTMF decoder (for soundblaster), which operates under windows (or even a GOOD one that operates under DOS)? I have a Fast Fourier Transform Program which will show the frequencies, but it is pretty time consuming to match up all those frequencies with the digit! Thanks.

Ryan

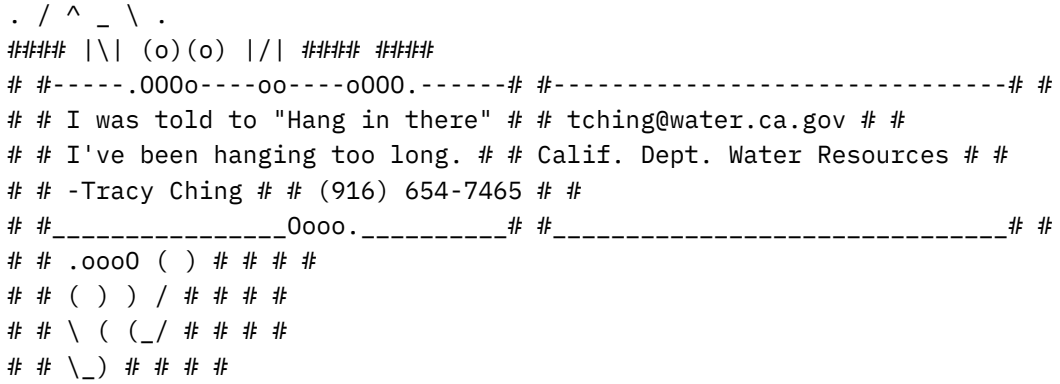
In addition to all this, is that the frequency that keys up all of
the repeaters in CA? Apparently the Cal. Dept. of General Services is
installing a setup whereby the CHP can bring up all their repeaters in CA
-in phase- with each other and broadcast to all CHP people.



7524. Addendum to PRO-2035 vs. PRO-2006 MT article

Newsgroup: rec.radio.scanner
Date: 1994-12-29 20:32:31 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <D1LAE7.89r@nntpa.cb.att.com>
Source record: 263486
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Addendum to:
The Radio Shack PRO-2035 Scanner:
How Does It Compare With the PRO-2006?

Copyright 1994 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

I compared the new 1000 channel Radio Shack PRO-2035 scanner with the discontinued PRO-2006 in my Jan. 1995 Monitoring Times Scanner Equipment Column.

Unfortunately, the article was too long to fit within the 1600 - 1800 word limit so some parts had to be cut (with my ok).

Here are the parts which do not appear in MT. The full length article is not currently available on line.

The PRO-2035 analyzed in the review was purchased from a local Radio Shack store and bears a serial number near 3000.

Here's a tip not mentioned in the owner's manual -- you can use the Auto Store mode to intentionally store the same frequency in several channels. Set both the lower and upper auto store limits to be the same frequency, open the squelch, and start the auto store search. The PRO-2035 will chug along, storing your favorite police or other frequency in all the channels in the banks you selected.

Although up conversion affords improved image rejection, triple conversion and frequency synthesis circuitry are complicated and several images were heard, especially on the PRO-2035.

On both the PRO-2006 and PRO-2035, images of paging transmitters were audible in the 159 - 162 MHz range. Analysis shows these signals to be 771.9975 MHz higher than the displayed frequency. For example, the 931.5125 MHz KOR933 paging transmitter, located more than 7 miles away, was heard when the PRO-2035 was tuned to 159.515 MHz.

A paging image hindered reception of a sheriff's repeater
in the next county on 159.15 MHz. The same paging images
were present but barely detectable on the PRO-2006.
Another image, heard only by the PRO-2035, appeared on
146.075 MHz, and it was actually a 904.075 MHz data
transmission.

The PRO-2035 received cellular phone images, reduced in
strength, between 1105 and 1115 MHz. The difference
between the actual and displayed frequencies varied:

PRO-2035 Actual Difference
tuned to transmitted
frequency
(Image) (Actual) (Actual - Image)
-------- ------- -------
1105.550 870.450 235.100
1107.875 876.120 231.755
1110.900 881.100 229.800
1113.470 886.530 226.940
1114.840 893.160 221.680

Congress passed a law this year making it illegal to listen to cordless phones, so you can feel safe now because nobody will be listening to your calls.

Before it was illegal to listen, a regular desktop scanner with the built in antenna could pick up calls from about 2 to 5 blocks away. A good external antenna might get 1/2 mile.

: It is NOT illegal to listen to cordless phone conversations on
: your scanner, unless you live in NY or CA which have state laws
: saying it's illegal. There are no federal laws prohibiting
: the intercepting of cordless phone transmissions.

: CELLULAR phones on the other hand are a whole different story. There
: are federal laws that say you cannot intentionally intercept cellular
: phone transmissions (or any radiotelephone services). Cordless
: phones are not considered radiotelephones.

Unfortunately, that is not the case anymore. Congress passed a law this
fall that treats cordless phones the same as cell phones for the purpose
of prohibiting interception. This law repealed the previous law that
explicitly said intercepting cordless was legal.

The rest of this law delt with increasing the FBI capability to wiretap
modern telephones including call forwarding and other advanced features.
The law also made it illegal to clone a cell phone ESN.

Here is an excerpt:

Public Law 103-414 signed Oct 25, 1994 (was H.R. 4922)

SEC. 202. CORDLESS TELEPHONES.
(a) Definitions. - Section 2510 of title 18, United States
Code, is amended -
(1) in paragraph (1), by striking `, but such term does not
include` and all that follows through `base unit`; and
(2) in paragraph (12), by striking subparagraph (A) and
redesignating subparagraphs (B), (C), and (D) as subparagraphs
(A), (B), and (C), respectively.
(b) Penalty. - Section 2511 of title 18, United States Code, is
amended -
(1) in subsection (4)(b)(i) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular
telephone communication,`; and
(2) in subsection (4)(b)(ii) by inserting `a cordless
telephone communication that is transmitted between the
cordless telephone handset and the base unit,` after `cellular

7529. Frequs. for Motorola GP-300 radios?

Newsgroup: rec.radio.scanner
Date: 1994-12-29 21:59:57 UTC
From: sternk@alumni.cs.colorado.edu
Message-ID: <3dvbgt$fo0@csnews.cs.Colorado.EDU>
Source record: 263493

I have been trying to determine what frequencies are being used by security in my office building. I asked a security person today and she replied that she didn't know the frequencies but that she sometimes hears transmissions from the building across the street.

The radio she was using was a Motorola GP-300. It had about a 6" antenna that was 1/2" thick.

I've tried scanning all the 'dot' and 'star' frequencies I've seen posted here but haven't heard anything yet. I've also just done random searches of the radio spectrum. While this has resulted in my finding other some-what interesting frequencies, I haven't heard anything that I thought was security here.

Does anyone know what frequencies are used by this model unit?

~Ken

No offense intended by my asking for a second opinion -- there have
been earlier posts contradicting yours; hence the need to hear from
others. The fact that the "A=nonmodifiable" rule is not true of
Pro-39's is certainly reason to suspect it may not for Pro-43's either
considering (1) they're proximate models (2) made by the same
manufacturer and (3) their serial numbers have the same digit-letter-
digit form.
So again -- can others (besides Jerry, whom I thank and now ask to
take a seat) please confirm or deny that any Pro-43 with an "A" in the
SN is non-modifiable? I've got a week-old 43 (SN 4A3) that I need to
decide whether to return before I open the puppy up.

> please send e-mail.

Having both a pro 43 and an ar8000, I find it ridiculous to
believe that anyone would take your offer seriously.
Anyone with the brains to buy and use an ar8000 isn't likely
to want to part from it much less consider a pro43.One who
finds the radio too complicated would merely return it for a
full refund.

The only thing your post accomplishs is to offer
a market for someone who may be in a position to steal one
and needs to unload it fast.

By the way I have a well used Pro 43 which you
may buy for $250 if you would like to mail me that amount.

An interesting item Bob. I can guess why it is not mentioned in
the manual.
ha ha

Another handhled scanner will not do this while auto storing
frequencies. It is smart enough to check and see if the freq
has already been found then it skips storing it again
wasting valuable memory, you only have a bank of 50
to store freq automatically with this handheld. I guess
the unit you refer to above has memory to burn and there was
no need to program in a check during the design phase.

It really depends on what you see your scanning preferences to be. I bought a handheld scanner as my first (and still only scanner) I have the Rad Shack Pro-51. It has a lot of intermod problems, but I still am fairly pleased with it. I decided to get the handheld first and then eventually save my beans and get a high-end table-top unit - perhaps an Icom. But for now, I like being able to carry my scanner wherever I go.

: ablilty to scan cell phone frequencies.

I believe the Pro-51 is /still/ cell modifiable, but I'm not sure, as I haven't kept up on it.

Read Monitoring Times for reviews of scanner. Find and join a local scanning club...

Here's another data point.
Today I received both the new Uniden/Bearcat base/mobile
BC9000XLT and portable BC3000XLT scanners.

The BC9000XLT search & store is quite civilized and will only
store unique frequencies found during a search.

The BC3000XLT's battery is still charging and I haven't tried
it yet.

From: cg1@ssnet.com
Message-ID: <3dvv6m$7kr@marlin.ssnet.com>
Source record: 263517

I just subscribed to Comcast/Cellular One, and chose a low-budget Motorola Flip Phone to do my talking. I remember much net-talk about these phones before I ever thought I'd own one, and now can't find any current info on their possible mis-use (i.e. how easy it is to steal my ESN, or override the lockout code I put on it, etc.) The only thing I can remember had to do with grounding the center pin at power-up [to do something I can't remember, and the manual poorly describes].

Any info about test modes, overrides, etc. would be greatly appreciated as a posting or as email to cg1@ssnet.com Thanks.

Richard,

It depends on where you are. These are all big systems and
frequncy use varies widely with several in some areas for dispatch, MoW,
PBX, switching, etc. For UPRR I'd start with 160.470, 160.740, 160.410
and 160.515. The road-dispatch is usually on one of those four. EsPee
often uses 160.550, I think (correction someone?). I've forgotten the
AT&SF freq. You really need a copy of the Compendium of North American RR
Freqs, published by Kalmbach books (the folks who publish TRAINS
magazine). It is advertised there every month and is DEFINITELY worht the
money. Good luck.

Someone could record the DTMF tones and call your bank and play the
tape in the phone and really screw-up your checking account!

>I wonder how many passwords of all kinds go out
>over scannable airwaves every day.

Too many. I work at a computer-oriented help desk. Before I ask for
the persons user ID (to check their accounts validity, etc.) I ask
them if they are using a cordless phone. Sometimes I can hear a buzz
or some interference. If they are on a cordless - I ask them to
change phones and then give me their ID. An ID by itself may not be of
any use, but too many times they say my ID is.... and my password is....
(They still give their password even though don't need nor ask for it.)

A local Monkey Ward store uses cordless telephones too. Mostly sales
people get calls about some product, etc. but I have heard them call
the credit department when there is a problem with a credit transaction
on their POS terminals.

I have a couple neighbors that admitted listening to our cordless calls
and knowing all along that I was 'broadcasting' to the neighborhood
anyway, I (hopefully) piss them off when I ask my wife to switch phones
just before the conversation starts getting good.

It appears that you may be confusing the serial number with the date code. The date code is inside the battery compartment, and is of the form xxAy, where the xx is the month of the year, the A is always present, and the 3 is the year.

A 4A3 will be modifiable, since it was manufactured in April of 1993. There have been several people who have posted here stating that they had a 4A4 and that it could not be modified - no diodes present.
